

DS32EL0421 , DS32ELX0421 125 - 312.5 MHz FPGA-Link Serializer with DDR LVDS Parallel Interface

Check for Samples: [DS32EL0421](#), [DS32ELX0421](#)

FEATURES

- 5-bit DDR LVDS Parallel Data Interface
- Programmable Transmit De-emphasis
- Configurable Output Levels (V_{OD})
- Selectable DC-balanced Encoder
- Selectable Data Scrambler
- Remote Sense for Automatic Detection and Negotiation of Link Status
- On Chip LC VCOs
- Redundant Serial Output (ELX device only)
- Data Valid Signaling to Assist with Synchronization of Multiple Receivers
- Supports AC- and DC-coupled Signaling
- Integrated CML and LVDS Terminations
- Configurable PLL Loop Bandwidth
- Programmable Output Termination (50Ω or 75Ω).
- Built-in Test Pattern Generator
- Loss of Lock and Error Reporting
- Configurable via SMBus
- 48-pin WQFN Package with Exposed DAP

TARGET APPLICATIONS

- Imaging: Industrial, Medical Security, Printers
- Displays: LED Walls, Commercial
- Video Transport
- Communication Systems
- Test and Measurement
- Industrial Bus

KEY SPECIFICATIONS

- 1.25 to 3.125 Gbps Serial Data Rate
- 125 to 312.5 MHz DDR Parallel Clock
- -40° to $+85^{\circ}\text{C}$ Temperature Range
- >8 kV ESD (HBM) Protection
- Low Intrinsic Jitter — 35ps at 3.125 Gbps

DESCRIPTION

The DS32EL0421/DS32ELX0421 is a 125 MHz to 312.5 MHz (DDR) serializer for high-speed serial transmission over FR-4 printed circuit board backplanes, balanced cables, and optical fiber. This easy-to-use chipset integrates advanced signal and clock conditioning functions, with an FPGA friendly interface.

The DS32EL0421/DS32ELX0421 serializes up to 5 parallel input LVDS channels to create a maximum data payload of 3.125 Gbps. If the integrated DC-balance encoding is enabled, the maximum data payload achievable is 2.5 Gbps.

The DS32EL0421/DS32ELX0421 serializers feature remote sense capability to automatically detect and negotiate link status with its companion DS32EL0124/DS32ELX0124 deserializers without requiring an additional feedback path.

The parallel LVDS interface reduces FPGA I/O pins, board trace count and alleviates EMI issues, when compared to traditional single-ended wide bus interfaces.

The DS32EL0421/DS32ELX0421 is programmable through a SMBus interface as well as through control pins.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PIN DESCRIPTIONS

Pin Name	Pin Number	I/O, Type	Description
Power, Ground and Analog Reference			
VDD33	1, 36	I, VDD	3.3V supply
VDD25	7, 15, 18, 25, 35	I, VDD	2.5V supply
VDDPLL	28	I, VDD	3.3V supply
VOD_CTRL	14	Analog	V _{OD} control. The serializer output amplitude can be adjusted by connecting this pin to a pull-down resistor. The value of the resistor determines the VOD. See CML LAUNCH AMPLITUDE for more details.
LF_CP	27	Analog	Loop filter connection for PLL
LF_REF	26	Analog	Loop filter ground reference
Exposed Pad	49	GND	Exposed Pad must be connected to GND by 9 vias
CML I/O			
TxOUT0+ TxOUT0-	16 17	O, CML	Inverting and non-inverting high speed CML differential outputs of the serializer. These outputs are internally terminated.
TxOUT1+ TxOUT1-	19 20	O, CML	DS32ELX0421 ONLY. Redundancy output. Inverting and non-inverting high speed CML differential outputs of the serializer. These outputs are internally terminated

PIN DESCRIPTIONS (continued)

Pin Name	Pin Number	I/O, Type	Description
LVDS Parallel Data Bus			
TxCLKIN+ TxCLKIN-	37 38	I, LVDS	Serializer input clock. TxCLKIN+/- are the inverting and non-inverting LVDS transmit clock input pins.
TxIN[4:0]+/-	39, 40, 41, 42, 43, 44, 45, 46, 47, 48	I, LVDS	Serializer input data. TxIN[4:0]+/- are the inverting and non-inverting LVDS serializer input data pins.
LVC MOS Control Pins			
$\overline{\text{DC_B}}$ $\overline{\text{RS}}$	5 6	I, LVC MOS	DC-balance and Remote Sense pins. See Device Configuration section DEVICE CONFIGURATION for device behavior.
DE_EMPH0 DE_EMPH1	9 10	I, LVC MOS	DE_EMPH0, DE_EMPH1 select the output de-emphasis level. These pins are internally pull-down. 00: Off 01: Low 10: Medium 11: Maximum
TXOUT1_EN	12	I, LVC MOS	DS32ELX0421 ONLY. When held high, redundant output TxOUT1+/- is enabled. This pin must be tied high when using TxOUT1+/-.
$\overline{\text{RESET}}$	30	I, LVC MOS	When held low, reset the device. 0 = Device Reset 1 = Normal operation
$\overline{\text{LOCK}}$	31	O, LVC MOS	Lock indication output. The input data on TxIN[0:4]+/- pins is ignored when LOCK pin is high.
SMBus Interface			
SCK	33	I/O, SMBus	SMBus compatible clock.
SDA	32	I/O, SMBus	SMBus compatible data line.
SMB_CS	34	I, SMBus	SMBus chip select. When held high, SMBus management control is enabled.
Other			
GPIO0	3	I/O, LVC MOS	Software configurable I/O pin.
GPIO1	4	I/O, LVC MOS	Software configurable I/O pin.
GPIO2	11	I/O, LVC MOS	Software configurable I/O pin.
NC	2, 8, 12, 13, 19, 20, 21, 22, 23, 24, 29	Misc.	No Connect, for DS32EL0421
	2, 8, 13, 21, 22, 23, 24, 29	Misc.	No Connect, for DS32ELX0421

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings ⁽¹⁾⁽²⁾

Supply Voltage (3.3V V_{DD33})	-0.3V to +4V
Supply Voltage (2.5V V_{DD25})	-0.3V to +3V
LVC MOS Input Voltage	-0.3V to ($V_{DD} + 0.3V$)
LVC MOS Output Voltage	-0.3V to ($V_{DD} + 0.3V$)
LVDS Input Voltage (IN+, IN-)	-0.3V to +3.6V
CML Output Voltage	-0.3V to +3.6V
Junction Temperature	+125°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature Range	
Soldering (4 sec.)	+260°C
Thermal Resistance, θ_{JA}	25°C/W
ESD Susceptibility	
HBM ⁽³⁾	>8 kV

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions.
- (2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (3) Human Body Model, applicable std. JESD22-A114C

Recommended Operating Conditions

	Min	Typ	Max	Units
Supply Voltage ($V_{DD33} - GND$)	3.135	3.3	3.465	V
Supply Voltage ($V_{DD25} - GND$)	2.375	2.5	2.625	V
Supply Noise Amplitude from 10 Hz to 50 MHz			100	mV _{P-P}
Ambient Temperature (T_A)	-40	+25	+85	°C

Power Supply Specifications

FUNCTIONAL DESCRIPTION

POWER SUPPLIES

The DS32EL0421 and DS32ELX0421 have several power supply pins, at 2.5V as well as 3.3V. It is important that these pins all be connected and properly bypassed. Bypassing should consist of parallel 4.7 μ F and 0.1 μ F capacitors as a minimum, with a 0.1 μ F capacitor on each power pin. A 22 μ F capacitor is required on the VDDPLL pin which is connected to the 3.3V rail.

These devices have a large contact in the center on the bottom of the package. This contact must be connected to the system GND as it is the major ground connection for the device.

POWER UP

It is recommended, although not necessary, to bring up the 3.3V power supply before the 2.5V supply. If the 2.5V supply is powered up first, an initial current draw of approximately 600mA from the 2.5V rail may occur before settling to its final value. Regardless of the sequence, both power rails should monotonically ramp up to their final values.

POWER MANAGEMENT

These devices have two methods to reduce power consumption. To enter the first power save mode, the on board host FPGA or controlling device can cease to output the DDR transmit clock. To further reduce power consumption, write 40'h to register 26'h and 10'h to register 01'h. This will put the device in its lowest power consumption mode.

RESET

There are three ways to reset these devices. A reset occurs automatically during power-up. The device can also be reset by pulling the **RESET** pin low, with normal operation resuming when the pin is driven high again. The device can also be reset by writing to the reset register. This reset will put all of the register values back to their default values, except it will not affect the address register value if the SMBus default address has been changed.

LVDS INPUTS

The DS32EL0421 and DS32ELX0421 have standard 2.5V LVDS inputs which are compliant with ANSI/TIA/EIA-644. These inputs have internal 100Ω termination resistors. It is recommended that the PCB trace between the FPGA and the serializer be less than 40-inches. Longer PCB traces may degrade the quality of the input signal. The connection between the host and the DS32EL0421 or DS32ELX0421 should be over a controlled impedance transmission line with impedance that matches the termination resistor – usually 100Ω. Setup and hold times are specified in the [LVDS Timing Specifications](#), however the clock delay can be adjusted by writing to register 30'h.

LOOP FILTER

The DS32EL0421 and DS32ELX0421 have an internal PLL which is used to generate the serialization clock from the parallel clock input. The loop filter for this PLL is external; and for optimum results, a 100nF capacitor and a 1.5 kΩ resistor in series should be connected between pins 26 and 27. See typical interface circuit ([Figure 11](#)).

CML LAUNCH AMPLITUDE

The launch amplitude of the CML output(s) is controlled by placing a single resistor from the VOD_CTRL pin to ground. Use the following equation to obtain the desired V_{OD} by selecting the corresponding resistor value.

$$R = (1400 \text{ mV} / V_{OD}) \times 9.1 \text{ k}\Omega \quad (1)$$

The CML output launch amplitude can also be adjusted by writing to SMBus register 69'h, bits 2:0. This register is meant to assist system designers during the initial prototype design phase. For final production, it is recommended that the appropriate resistor value be selected for the desired V_{OD} and that register 69'h be left to its default value.

REMOTE SENSE

The remote sense feature can be used when a DS32EL0421 or DS32ELX0421 serializer is directly connected to a DS32EL0124 or DS32ELX0124 deserializer. Active components in the signal path between the serializer and the deserializer may interfere with the back channel signaling of the devices.

When remote sense is enabled, the serializer will cycle through four states to successfully establish a link and align the data. The state diagram for the serializer is shown in [Figure 7](#). The serializer will remain in the low power IDLE state until it receives an input clock. Once the PLL of the serializer has locked to the input clock, the device will enter the LINK DETECT state. While in this state, the serializer will monitor the line to see if the deserializer is present. If a deserializer is detected, the serializer will enter the LINK ACQUISITION state. The serializer will transmit the entire training pattern and then enter the NORMAL state. If the deserializer is unable to successfully lock or maintain lock it will break the link, sending the serializer back to the IDLE or LINK DETECT states.

With the Remote Sense feature active, the serializer can be forced out of lock due to events on the high speed serial line in two ways, a serial channel reset signal is sent upstream from the deserializer or the near end termination detect circuit signals and open termination was detected. The upstream signal sent from the deserializer that resets the serializer is called the link detect signal. Since the serializer and deserializer may power up at different times, the deserializer will transmit this link detect signal periodically, once it detects that a serializer is active on the other side of the high speed line. When a serializer receives the link detect signal, it will return to the LINK DETECT state. The near end open termination detection circuit will trigger only for near end open termination events, such as unplugging the cable on the serializer end of the line.

DC-BALANCE ENCODER

The DS32EL0421 and DS32ELX0421 have a built-in DC-balance encoder to support AC-coupled applications. When enabled, the input signal on TXIN4+/- is treated as a data valid bit. If TXIN4+/- is low, then the four bit nibbles from TXIN0-TXIN3 are taken to form a 16 bit word. This 16 bit word is processed as two 8 bit words and converted to two 10 bit words by using the standard 8b/10b data coding scheme. The two 10 bit words are then combined to create a 20 bit code. This 20 bit word is serialized and driven on the output. The nibble taken in on the rising edge of the clock is the most significant nibble and the nibble taken in on the falling edge is the least significant nibble. If TXIN4+/- is high, then the inputs TXIN0 -TXIN3 are ignored and a programmable DC-balanced SYNC character is inserted in the output stream. The default character is a K28.5 code. In order to send other K codes, they must first be programmed into the serializer via the SMBus. The SMBus registers allows for only a single programmable character.

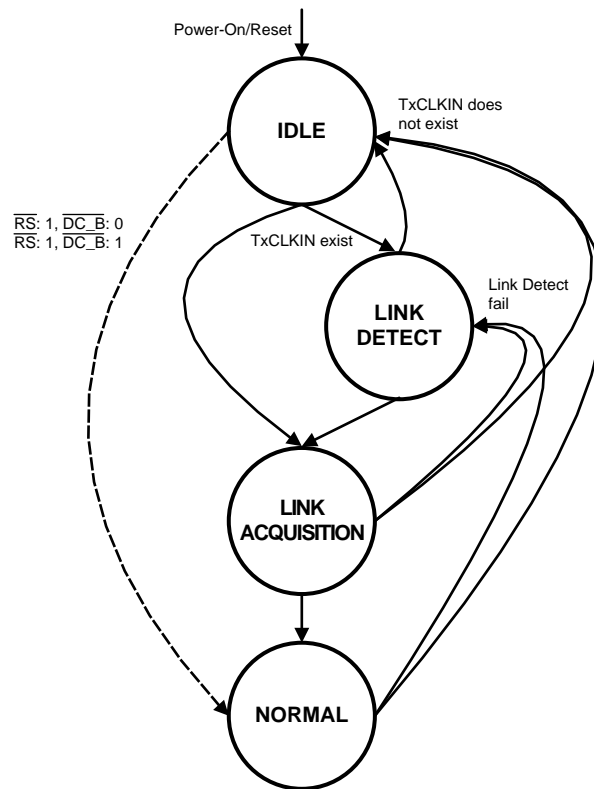

Figure 7. Serializer State Diagram

SCRAMBLER and NRZI Encoder

The CDR of the DS32EL0124 and the DS32ELX0124 expect a transition density of 20% for a period of 200 μ s. If the scrambler and NRZI encoder are enabled, the raw or DC-balanced serialized data is scrambled to improve transition density. The scrambler accepts 20 bits of data and encodes it using the polynomial $X^9 + X^4 + 1$. The data can then be sent to the NRZ-to-NRZI converter before being output.

Enabling the scrambler can help to lower EMI emissions by spreading the spectrum of the data. Scrambling also creates transitions for the deserializer's CDR to properly lock onto.

The scrambler and NRZI encoder are enabled or disabled by default depending on how the $\overline{DC_B}$ and \overline{RS} pins are configured. To override the default scrambler setting two register writes must be performed. First, write to register 22'h and set bit 3 to unlock the scrambler register. Next write to register 21'h and change bit 4 to the desired value. The NRZI encoder can be enabled or disabled independently of the scrambler by controlling bit 7 of register 21'h and bit 4 of register 22'h.

CML OUTPUT DATA INTERFACING

The serial outputs provide low-skew differential signals. Internal resistors connected from TxOUTn+ and TxOUTn- to VDD25 terminate the outputs. The output level can be programmed by adjusting the pull-down resistor to the VOD_CTRL pin. The output terminations can also be programmed to be either 50 Ω or 75 Ω .

The output buffer consists of a current mode logic (CML) driver with user configurable de-emphasis control, which can be used to optimize performance over a wide range of transmission line lengths and attenuation distortions resulting from low cost CAT(-5, -6, -7) cable or FR-4 backplane. Output de-emphasis is user programmable through either device pins DE_EMPH0 and DE_EMPH1 or SMBus interface. Users can control the strength of the de-emphasis to optimize for a specific system environment. Please see [Table 1](#) for details.

Table 1. De-Emphasis Control Table

DE_EMPH[1:0]	Output De-Emphasis Level
00'b	Off
01'b	Low
10'b	Medium
11'b	High

The DS32ELX0421 provides a secondary serial output, supporting redundancy applications. The redundant output driver can be enabled by setting TXOUT1_EN pin to HIGH or by activating it through the SMBus registers.

DEVICE CONFIGURATION

There are four ways to configure the DS32EL0421 and DS32ELX0421 serializers, these combinations are shown in [Table 2](#). Refer to [Figure 7](#) to see how the combinations of the \overline{RS} and $\overline{DC_B}$ pins change the link startup behavior of the serializers. When connecting to a deserializer other than the DS32EL0124 or DS32ELX0124, Remote Sense should be disabled. The scrambler and NRZI encoder shown in [Table 2](#) can be enabled or disabled through register programming.

When Remote Sense is enabled, with \overline{RS} pin tied low, the serializer must be connected directly to a DS32EL0124 or DS32ELX0124 deserializer without any active components between them. The Remote Sense module features an upstream communication method for the serializer and deserializer to communicate. This feature is used to pass link status information between the 2 devices. When Remote Sense is enabled the serializer will send a training pattern to the deserializer to establish lock and lane alignment.

If DC-Balance is enabled, a maximum of 4 parallel LVDS lanes can be used to receive data. The fifth lane (TXIN4±) is used for Data Valid signaling. Each time a serializer establishes a link to a deserializer with DC-Balance enabled and Remote Sense disabled, the Data Valid input to the serializer must be held high for 110 LVDS clock periods. If the Data Valid input to the serializer is logic HIGH, then SYNC characters are transmitted. If the deserializer receives a SYNC character, then the LVDS data outputs will all be logic low and the Data Valid output will be logic high. If the deserializer detects a DC-Balance code error, the output data pins will be set to logic high with the Data Valid output also set to logic high.

In the case where DC-Balance is enabled and Remote Sense is disabled, with \overline{RS} set to high and $\overline{DC_B}$ set to low, it is recommended that the host device periodically toggle the Data Valid input to the serializer, to transmit SYNC symbols on the line, to ensure that the deserializer is and remains locked. In this configuration the deserializer or receiving device does not have a way to directly notify the serializer if it has lost lock. Periodically sending SYNC symbols will allow the receiving system to reacquire lock if a problem has occurred. With these pin settings the DS32EL0421/DS32ELX0421 and DS32EL0124/DS32ELX0124 devices can interface with other active component in the high speed signal path, such as fiber modules.

When both Remote Sense and DC-Balance are disabled, \overline{RS} and $\overline{DC_B}$ pins set to high, the LVDS lane alignment is not maintained. In this configuration, data formatting is handled by an FPGA or external source. This pin setting combination also allows for the DS32EL0421/DS32ELX0421 devices to interface with active components other than the DS32EL0124/DS32ELX0124 in the high speed signal path. In this configuration the host device is responsible for DC balancing the data in an AC coupled application.

Table 2. Device Configuration Table

Remote Sense Pin (RS)	DC-Balance Pin ($\overline{DC_B}$)	Configuration
0	0	Remote Sense enabled DC-Balance enabled Data Alignment Scrambler and NRZI encoder disabled by default
0	1	Remote Sense enabled DC-Balance disabled Data Alignment Scrambler and NRZI encoder enabled by default
1	0	Remote Sense disabled DC-Balance enabled Data Alignment Scrambler and NRZI encoder enabled by default
1	1	Remote Sense disabled DC-Balance disabled No Data Alignment Scrambler and NRZI encoder disabled by default

SMBus INTERFACE

The System Management Bus interface is compatible to SMBus 2.0 physical layer specification. The use of the Chip Select signal is **required**. Holding the SMB_CS pin HIGH enables the SMBus port, allowing access to the configuration registers. Holding the SMB_CS pin LOW disables the device's SMBus, allowing communication from the host to other slave devices on the bus. In the STANDBY state, the System Management Bus remains active. When communication to other devices on the SMBus is active, the SMB_CS signal for the serializer must be driven LOW.

The address byte for all DS32EL0421 and DS32ELX0421 devices is AE'h. Based on the SMBus 2.0 specification, these devices have a 7-bit slave address of 1010111'b. The LSB is set to 0'b (for a WRITE), thus the 8-bit value is 1010 1110 'b or AE'h.

The SCK and SDA pins are 3.3V LVCMOS signaling and include high-Z internal pull up resistors. External low impedance pull up resistors maybe required depending upon SMBus loading and speed. Note, these pins are not 5V tolerant.

Transfer of Data via the SMBus

During normal operation the data on SDA must be stable during the time when SCK is HIGH.

There are three unique states for the SMBus:

- START** A HIGH to LOW transition on SDA while SCK is HIGH indicates a message START condition
- STOP** A LOW to HIGH transition on SDA while SCK is HIGH indicates a message STOP condition.
- IDLE** If SCK and SDA are both high for a time exceeding t_{BUF} from the last detected STOP condition or if they are HIGH for a total exceeding the maximum specification for t_{HIGH} then the bus will transfer to the IDLE state.

SMBus Transactions

The devices support WRITE and READ transactions. See Register Description Table for register address, type (Read/ Write, Read Only), default value and function information.

Writing to a Register

To write a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host (Master) selects the device by driving its SMBus Chip Select (SMB_CS) signal HIGH.
2. The Host drives a START condition, the 7-bit SMBus address, and a "0" indicating a WRITE.
3. The Device (Slave) drives the ACK bit ("0").
4. The Host drives the 8-bit Register Address.
5. The Device drives an ACK bit ("0").

6. The Host drive the 8-bit data byte.
7. The Device drives an ACK bit (“0”).
8. The Host drives a STOP condition.
9. The Host de-selects the device by driving its SMBus CS signal Low.

The WRITE transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

Reading a Register

To read a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host (Master) selects the device by driving its SMBus Chip Select (SMB_CS) signal HIGH.
2. The Host drives a START condition, the 7-bit SMBus address, and a “0” indicating a WRITE.
3. The Device (Slave) drives the ACK bit (“0”).
4. The Host drives the 8-bit Register Address.
5. The Device drives an ACK bit (“0”).
6. The Host drives a START condition.
7. The Host drives the 7-bit SMBus Address, and a “1” indicating a READ.
8. The Device drives an ACK bit “0”.
9. The Device drives the 8-bit data value (register contents).
10. The Host drives a NACK bit “1” indicating end of the READ transfer.
11. The Host drives a STOP condition.
12. The Host de-selects the device by driving its SMBus CS signal Low.

The READ transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

SMBus Configurations

Many different configurations of the SMBus are possible and depend upon the specific requirements of the applications. Several possible applications are described.

Configuration 1

The deserializer SMB_CS may be tied High (always enabled) since it is the only device on the SMBus. See [Figure 8](#).

Configuration 2

Since the multiple SER devices have the same address, the use of the individual SMB_CS signals is required. To communicate with a specific device, its SMB_CS is driven High to select the device. After the transaction is complete, its SMB_CS is driven Low to disable its SMB interface. Other devices on the bus may now be selected with their respective chip select signals and communicated with. See [Figure 9](#).

Configuration 3

The addressing field is limited to 7-bits by the SMBus protocol. Thus it is possible that multiple devices may share the same 7-bit address. An optional feature in the SMBus 2.0 specification supports an Address Resolution Protocol (ARP). This optional feature is not supported by the DS32EL0421/DS32ELX0421 devices. Solutions for this include: the use of the independent SMB_CS signals, independent SMBus segments, or other means.

Figure 8. SMBus Configuration 1

Figure 9. SMBus Configuration 2

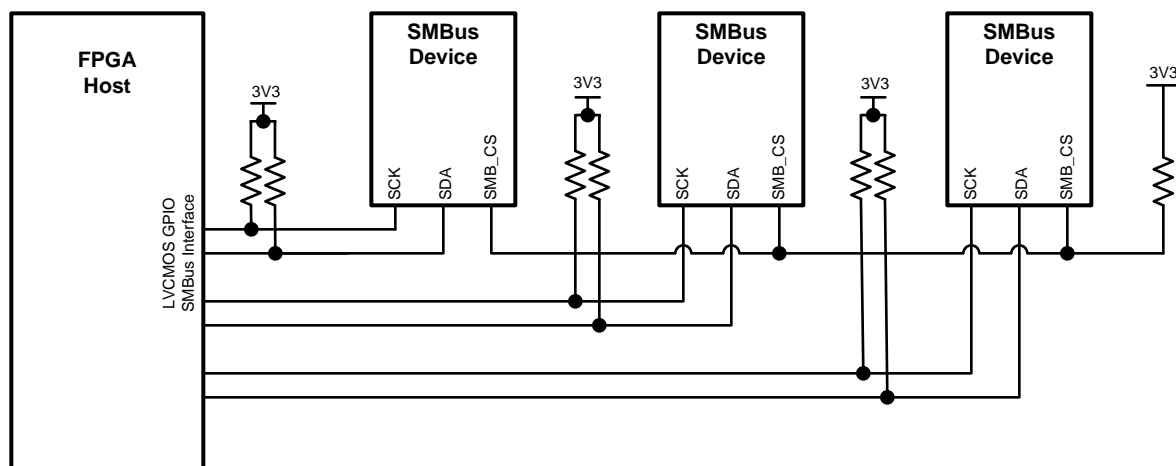

Figure 10. SMBus Daisy Chained CS Configuration

PROPAGATION DELAY

Once the serializer is locked, the amount of time it takes for a bit to travel into the device through the DDR LVDS inputs and out through the CML serial output is defined to be the propagation delay. The propagation delay through the DS32EL0421/DS32ELX0421 due to the analog circuitry is considered negligible compared to the time delay caused by the digital components. The information presented in this section allows system designers to predict the propagation delay through the device in terms of clock cycles which are proportional to the high speed serial line rate.

Each clock cycle shown in [Table 3](#) is defined to be 1/2 t_{CIP} . Note at 3.125Gbps, t_{CIP} is 312.5MHz, T is 1/2 t_{CIP} or 156.25MHz which is 6.40ns per clock..

Table 3. Serializer Propagation Delay

Config. Pins (DC_B, RS)	LVDS Interface	DC Balance Encoder	Scrambler	NRZ Encoder	CML interface	Analog Delay	Total Propagation Delay
Data Flow (left to right)							
0, 0	3 clocks	1 clock	–	–	5 – 6 clocks	2 clocks + ~5.5ns	11 – 12 clocks + ~5.5ns
0, 1	3 clocks	1 clock	1 clock	1 clock	5 – 6 clocks	2 clocks + ~5.5ns	13 – 14 clocks + ~5.5ns
1, 0	3 clocks	–	1 clock	1 clock	5 – 6 clocks	2 clocks + ~5.5ns	12 – 13 clocks + ~5.5ns
1, 1	3 clocks	–	–	–	5 – 6 clocks	2 clocks + ~5.5ns	10 – 11 clocks + ~5.5ns

Application Information

GPIO PINS

The GPIO pins can be useful tools when debugging or evaluating the system. For specific GPIO configurations and functions refer to registers 2, 3, 4, 5 and 6 in the device register map.

GPIO pins are commonly used when there are multiple serializers on the same SMBus. In order to program individual settings into each serializer, they will each need to have a unique SMBus address. To reprogram multiple serializers on a single SMBus, configure the first serializer such that the SMBus lines are connected to the FPGA or host controller. The CS pin of the second serializer should be tied to GPIO0 of the first serializer, with the CS pin of the next serializer tied to GPIO0 of its preceding serializer. By holding all of the GPIO0 pins low, the first serializer's address may now be reprogrammed by writing to register 0. The first serializer's GPIO pin can now be asserted and the second serializer's address may now be reprogrammed.

HIGH SPEED COMMUNICATION MEDIA

Using the serializer's integrated de-emphasis blocks in combination with the DS32EL0124 or DS32ELX0124's integrated equalization blocks allows data to be transmitted across a variety of media at high speeds. Factors that can limit device performance include excessive input clock jitter, noisy power rails, EMI from nearby noisy components and poor layout techniques. Although many cables contain wires of similar gauge and shielding, performance can vary greatly depending on the quality of the connector.

REDUNDANCY APPLICATIONS

The DS32ELX0421 has two high speed CML serial outputs. SMBus register control allows the device to use a single output exclusively, or both outputs simultaneously. This allows a single serializer to transmit data to two independent receiving systems, a primary and secondary endpoint. Some applications require a redundancy measure in case the primary signal path is compromised. The secondary output can be activated "on-the-go", if a problem is detected on the primary link. See the [Redundancy / Fail Over Configuration](#) section located under [Register Recipes](#).

LINK AGGREGATION

Multiple DS32EL0421/DS32ELX0421 serializers and D32EL0124/DS32ELX0124 deserializers can be aggregated together if an application requires a data throughput of more than 3.125 Gbps. By utilizing the data valid signal of each device, the system can be properly deskewed to allow for a single cable, such as CAT-6, DVI-D, or HDMI, to carry data payloads beyond 3.125 Gbps.

Link aggregation configurations can also be implemented in applications which require longer cable lengths. In these type of applications the data rate of each serializer and deserializer chipset can be reduced, such that the applications' net data throughput is still the same. Since each high speed channel is now operating at a fraction of the original data rate, the loss over the cable is reduced, allowing for greater lengths of cable to be used in the system.

For more information regarding link aggregation please see [SNLA109](#), Expanding the Payload with TI's FPGA-Link DS32ELX0421 and DS32ELX0124 Serializer and Deserializer.

LAYOUT GUIDELINES

It is important to follow good layout practices for high speed devices. The length of LVDS input traces should not exceed 40 inches. In noisy environment the LVDS traces may need to be shorter to prevent data corruption due to EMI. Noisy components should not be placed next to the LVDS or CML traces. The LVDS and CML traces must have a controlled differential impedance of 100 Ω. Do not place termination resistor at the LVDS inputs or CML outputs, the DS32EL0421 and DS32ELX0421 have internal termination resistors. It is recommended to avoid using vias. Vias create an impedance mismatch in the transmission line and result in reflections, which can greatly lower the maximum distance of the high speed data link. If vias are required, they should be placed symmetrically on each side of the differential pair. For more tips and detailed suggestions regarding high speed board layout principles, please consult the LVDS Owner's Manual.

Figure 11. Typical Interface Circuit

Typical Performance Characteristics

The eye diagrams shown below illustrate the typical performance of the DS32ELX0421/DS32EL0421 configured with $\overline{RS} = 0, \overline{DC_B} = 0$, for the conditions listed below each figure. The PRBS-15 data was generated by a low cost FPGA, which used an LMK03000C to generate the various clock frequencies.

Register Map

The register information for the serializer is shown in the table below. Some registers have been omitted or marked as reserved; these are for internal testing and should not be written to. Some register bits require an override bit to be set before they can be written to.

Addr (Hex)	Name	Bits	Field	R/W	Default	Description
00	Device ID	7:1	SMBus Address	R/W	57'h	Some systems will use all 8 bits as the device ID. This will shift the value from 57'h to AE'h
		0	Reserved		0

Register Recipes

Many features of the serializer contained within the SMBus registers require multiple writes to configure and enable. This methodology was implemented to prevent accidental register writes from causing undesired device behavior. Several recipes for common features are listed below. When experimenting with other SMBus register features, be sure to read through the register map for override and enable bits.

SCRAMBLER OVERRIDE CONTROL

The scrambler's default settings are described in the [DEVICE CONFIGURATION](#) section. However, the scrambler's setting can be overridden if desired.

Reg 22'h, write 08'h

Reg 21'h, write to bit 3 to enable/disable

75Ω MODE

The serializer can be programmed to interface with 75Ω media by using the recipe shown below. The inverting serial output should be terminated when interfacing with single ended media.

Reg 2F'h, write 0 to bit 5

OUTPUT CHANNEL MUX CONTROL

DS32ELX0421 only. TxOUT0 is the output channel enabled by default. By using the external pin TxOUT1_EN, TxOUT1 will be activated along with TxOUT0. If an application requires that only one channel be active at a time, the following recipe allows for each channel to be enabled or disabled independent of the other.

Reg 2F'h, write 1'b to bit 2

Reg 2F'h, write to bits 1 or 0 to control the output channels

OUTPUT THE SERIAL CLOCK ON GPIO2

It is very helpful to be able to monitor high speed communication systems and observe their signal integrity. Generally, this is done with a high speed real time oscilloscope or a sampling oscilloscope. Sampling oscilloscopes require a reference clock to trigger on. The following recipe can be used to bring out the serial clock on GPIO2 to provide a trigger for sampling oscilloscopes.

Reg 04'h, write 21'h

Power Save Mode

When a system does not need to transmit high speed data from the DS32EL0421 or DS32ELX0421, the power consumption of the device can be managed as described in the [POWER MANAGEMENT](#) section on the Functional Description page. The following recipe powers down many of the analog and digital blocks in the serializer, but leaves the SMBus module operational. Please note that in order to resume normal operation the recipe below will have to be unwritten.

Reg 01'h, write 10'h

Reg 26'h, write 40'h

Redundancy / Fail Over Configuration

DS32ELX0421 only. Implementing a redundancy system with the DS32ELX0421 can be done in several ways. One method would be to program the redundancy or fail over logic into the host device or FPGA. The recipe below will describe a different method, for which a DS32ELX0421 will communicate to two different DS32EL0124 deserializers. The recipe below will configure the DS32ELX0421 serializer to automatically switch to the alternate output when the current high speed link fails.

Configure all device with Remote Sense enabled either by pin or register control. Pull TxOUT1_EN pin high

reg 2F'h, write 2D'h

Reg 2F'h, write 28'h

REVISION HISTORY

DS32EL0421SQ/NOPB	ACTIVE	WQFN	RHS	48	1000	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	32EL0421	Samples
DS32EL0421SQE/NOPB	ACTIVE	WQFN	RHS	48	250	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	32EL0421	Samples
DS32EL0421SQX/NOPB	ACTIVE	WQFN	RHS	48	2500	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	32EL0421	Samples
DS32ELX0421SQE/NOPB	ACTIVE	WQFN	RHS	48	250	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	32ELX0421	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
