

## LMV61x Single, Dual, and Quad, 1.4-MHz, Low-Power, General-Purpose 1.8-V Operational Amplifiers

### 1 Features

- Supply Values: 1.8 V (Typical)
- Ensured 1.8-V, 2.7-V, and 5-V Specifications
- Output Swing:
  - 80 mV From Rail With 600-Ω Load
  - 30 mV From Rail With 2-kΩ Load
- $V_{CM} = 200$  mV Beyond Rails
- 100-μA Supply Current (Per Channel)
- 1.4-MHz Gain Bandwidth Product
- Maximum  $V_{OS} = 4$  mV
- Temperature Range:  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$

### 2 Applications

- Consumer Communication
- Consumer Computing
- PDAs
- Audio Pre-Amplifiers
- Portable or Battery-Powered Electronic Equipment
- Supply Current Monitoring
- Battery Monitoring

### 3 Description

The LMV61x devices are single, dual, and quad low-voltage, low-power operational amplifiers (op amps). They are designed specifically for low-voltage, general-purpose applications. Other important product characteristics are, rail-to-rail input or output, low supply voltage of 1.8 V and wide temperature range. The LMV61x input common mode extends 200 mV beyond the supplies and the output can swing rail-to-rail unloaded and within 30 mV with 2-kΩ load at 1.8-V supply. The LMV61x achieves a gain bandwidth of 1.4 MHz while drawing 100-μA (typical) quiescent current.

The industrial-plus temperature range of  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  allows the LMV61x to accommodate a broad range of extended environment applications.

The LMV611 is offered in the tiny 5-pin SC70 package, the LMV612 in space-saving 8-pin VSSOP and SOIC packages, and the LMV614 in 14-pin TSSOP and SOIC packages. These small package amplifiers offer an ideal solution for applications requiring minimum PCB footprint. Applications with area constrained PCB requirements include portable and battery-operated electronics.

#### Typical Application

$$V_{OUT} = \frac{R_{SENSE} \cdot R_3}{R_1} \cdot I_{CHARGE} \approx 1 \Omega \cdot I_{CHARGE}$$

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (March 2013) to Revision C	Page
• Added <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	<b>1</b>
• Changed values in the <i>Thermal Information</i> table to align with JEDEC standards .....	<b>5</b>

Changes from Revision A (March 2012) to Revision B	Page
• Changed layout of National Semiconductor Data Sheet to TI format .....	<b>1</b>

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)(3)</sup>

	MIN	MAX	UNIT
Differential input voltage	±Supply voltage		
Supply voltage (V <sup>+</sup> –V <sup>–</sup> )		6	V
Voltage at input or output pin	V <sup>–</sup> – 0.3	V <sup>+</sup> + 0.3	V
Junction temperature, T <sub>JMAX</sub> <sup>(4)</sup>		150	°C
Storage temperature, T <sub>stg</sub>	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) Soldering specifications for all packages available at [www.ti.com](http://www.ti.com) and *Absolute Maximum Ratings for Soldering*.
- (4) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub>, and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> – T<sub>A</sub>) / R<sub>θJA</sub>. All numbers apply for packages soldered directly onto a PCB.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Machine model (MM) <sup>(2)</sup>	±200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) Machine model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC) Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply voltage	1.8	5.5	V
Temperature	–40	125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LMV611		LMV612		LMV614		UNIT

- (1) Electrical characteristics values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that  $T_J = T_A$ . No assurance of parametric performance is indicated in the electrical tables under conditions of internal self-heating where  $T_J > T_A$ . See [Application and Implementation](#) for information of temperature derating of the device. [Absolute Maximum Ratings](#) indicated junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) All limits are specified by testing or statistical analysis.
- (3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and also depends on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (4) For specified temperature ranges, see Input common mode voltage specifications.
- (5) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ . Output currents in excess of  $45\text{ mA}$  over long term may adversely affect reliability.

## 6.6 Electrical Characteristics – 1.8 V (AC)

All limits ensured for  $T_J = 25^\circ\text{C}$ ,  $V^+ = 1.8\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{CM} = V^+ / 2$ ,  $V_O = V^+ / 2$ , and  $R_L > 1\text{ M}\Omega$  (unless otherwise noted).<sup>(1)</sup>

PARAMETER	TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
SR	Slew rate <sup>(4)</sup>		0.35		V/ $\mu\text{s}$
GBW	Gain-bandwidth product		1.4		MHz
$\Phi_m$	Phase margin		67		°
$G_m$	Gain margin		7		dB
$e_n$	Input-referred voltage noise	$f = 10\text{ kHz}$ , $V_{CM} = 0.5\text{ V}$	60		nV/ $\sqrt{\text{Hz}}$
$i_n$	Input-referred current noise	$f = 10\text{ kHz}$	0.08		pA/ $\sqrt{\text{Hz}}$
THD	Total harmonic distortion	$f = 1\text{ kHz}$ , $A_V = +1$ , $R_L = 600\ \Omega$ , $V_{IN} = 1\text{ V}_{PP}$	0.023%		
	Amp-to-amp isolation <sup>(5)</sup>		123		dB

- (1) Electrical characteristics values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that  $T_J = T_A$ . No assurance of parametric performance is indicated in the electrical tables under conditions of internal self-heating where  $T_J > T_A$ . See [Application and Implementation](#) for information of temperature derating of the device. [Absolute Maximum Ratings](#) indicated junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) All limits are specified by testing or statistical analysis.
- (3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and also depends on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (4) Connected as voltage follower with input step from  $V^-$  to  $V^+$ . Number specified is the slower of the positive and negative slew rates.
- (5) Input-referred,  $R_L = 100\text{ k}\Omega$  connected to  $V^+ / 2$ . Each amp excited in turn with  $1\text{ kHz}$  to produce  $V_O = 3\text{ V}_{PP}$  (for supply voltages  $< 3\text{ V}$ ,  $V_O = V^+$ ).

## 6.7 Electrical Characteristics – 2.7 V (DC)

All limits ensured for  $T_J = 25^\circ\text{C}$ ,  $V^+ = 2.7\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{CM} = V^+ / 2$ ,  $V_O = V^+ / 2$ , and  $R_L > 1\text{ M}\Omega$  (unless otherwise noted).<sup>(1)</sup>

PARAMETER	TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
$V_{OS}$	Input offset voltage	LMV611 (single)	1	4	mV
		LMV612 (dual) and LMV614 (quad)	1	5.5	
$TCV_{OS}$	Input offset voltage average drift		5.5		$\mu\text{V}/^\circ\text{C}$
$I_B$	Input bias current		15		nA
$I_{OS}$	Input offset current		8		nA
$I_S$	Supply current (per channel)		105	190	$\mu\text{A}$
CMRR	Common-mode rejection ratio	LMV611, $0\text{ V} \leq V_{CM} \leq 1.5\text{ V}$ , $2.3\text{ V} \leq V_{CM} \leq 2.7\text{ V}$ <sup>(4)</sup>	60	81	dB
		LMV612 and LMV614, $0\text{ V} \leq V_{CM} \leq 1.5\text{ V}$ , $2.3\text{ V} \leq V_{CM} \leq 2.7\text{ V}$ <sup>(4)</sup>	55	80	
		$-0.2\text{ V} \leq V_{CM} \leq 0\text{ V}$ , $2.7\text{ V} \leq V_{CM} \leq 2.9\text{ V}$	50	74	
PSRR	Power supply rejection ratio	$1.8\text{ V} \leq V^+ \leq 5\text{ V}$ , $V_{CM} = 0.5\text{ V}$	100		dB

- (1) Electrical characteristics values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that  $T_J = T_A$ . No assurance of parametric performance is indicated in the electrical tables under conditions of internal self-heating where  $T_J > T_A$ . See [Application and Implementation](#) for information of temperature derating of the device. [Absolute Maximum Ratings](#) indicated junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) All limits are specified by testing or statistical analysis.
- (3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and also depends on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (4) For specified temperature ranges, see input common mode voltage specifications.

## Electrical Characteristics – 2.7 V (DC) (continued)

All limits ensured for  $T_J = 25^\circ\text{C}$ ,  $V^+ = 2.7\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{CM} = V^+/2$ ,  $V_O = V^+/2$ , and  $R_L > 1\text{ M}\Omega$  (unless otherwise noted).<sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
$V_{CM}$	Input common-mode voltage	$V^-, T_A = 25^\circ\text{C}$	$V^- - 0.2$	-0.2		V
		$V^+, T_A = 25^\circ\text{C}$		3	$V^+ + 0.2$	
		$T_A = -40^\circ\text{C}$ to $85^\circ\text{C}$	$V^-$		$V^+$	
		$T_A = 125^\circ\text{C}$	$V^- + 0.2$		$V^+ - 0.2$	
$A_V$	Large signal voltage gain LMV611 (single)	$R_L = 600\ \Omega$ to $1.35\text{ V}$ , $V_O = 0.2\text{ V}$ to $2.5\text{ V}$	87	104		dB
		$R_L = 2\text{ k}\Omega$ to $1.35\text{ V}$ , $V_O = 0.2\text{ V}$ to $2.5\text{ V}$	92	110		
	Large signal voltage gain LMV612 (dual) and LMV614 (quad)	$R_L = 600\ \Omega$ to $1.35\text{ V}$ , $V_O = 0.2\text{ V}$ to $2.5\text{ V}$	78	90		
		$R_L = 2\text{ k}\Omega$ to $1.35\text{ V}$ , $V_O = 0.2\text{ V}$ to $2.5\text{ V}$	81	100		
$V_O$	Output swing	$R_L = 600\ \Omega$ to $1.35\text{ V}$	2.55	2.62		V
		$V_{IN} = \pm 100\text{ mV}$		0.083	0.11	
		$R_L = 2\text{ k}\Omega$ to $1.35\text{ V}$	2.65	2.675		
		$V_{IN} = \pm 100\text{ mV}$		0.025	0.04	
$I_O$	Output short-circuit current <sup>(5)</sup>	Sourcing, $V_O = 0\text{ V}$ , $V_{IN} = 100\text{ mV}$		30		mA
		Sinking, $V_O = 0\text{ V}$ , $V_{IN} = -100\text{ mV}$		25		

(5) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ . Output currents in excess of 45 mA over long term may adversely affect reliability.

## 6.8 Electrical Characteristics – 2.7 V (AC)

All limits ensured for  $T_J = 25^\circ\text{C}$ ,  $V^+ = 2.7\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{CM} = 1\text{ V}$ ,  $V_O = 1.35\text{ V}$ , and  $R_L > 1\text{ M}\Omega$  (unless otherwise noted).<sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
SR	Slew rate <sup>(4)</sup>			0.4		V/ $\mu\text{s}$
GBW	Gain-bandwidth product			1.4		MHz
$\Phi_m$	Phase margin			70		°
$G_m$	Gain margin			7.5		dB
$e_n$	Input-referred voltage noise	$f = 10\text{ kHz}$ , $V_{CM} = 0.5\text{ V}$		57		nV/ $\sqrt{\text{Hz}}$
$i_n$	Input-referred current noise	$f = 10\text{ kHz}$		0.08		pA/ $\sqrt{\text{Hz}}$
THD	Total harmonic distortion	$f = 1\text{ kHz}$ , $A_V = +1$ , $R_L = 600\ \Omega$ , $V_{IN} = 1\text{ V}_{PP}$		0.022%		
Amp-to-amp isolation <sup>(5)</sup>				123		dB

- (1) Electrical characteristics values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that  $T_J = T_A$ . No assurance of parametric performance is indicated in the electrical tables under conditions of internal self-heating where  $T_J > T_A$ . ## 7 Detailed Description

### 7.1 Overview

The LMV61x devices achieve a gain bandwidth of 1.4 MHz while drawing 100- $\mu$ A (typical) quiescent current. They also provide a rail-to-rail input with a maximum input offset voltage of 4 mV. Lastly, the LMV61x input common mode extends 200 mV beyond the supplies and the output can swing rail-to-rail unloaded and within 30 mV with 2-k $\Omega$  load at 1.8-V supply.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Input and Output Stage

The rail-to-rail input stage of this family provides more flexibility for the designer. The LMV61x use a complimentary PNP and NPN input stage in which the PNP stage senses common-mode voltage near  $V^-$  and the NPN stage senses common-mode voltage near  $V^+$ . The transition from the PNP stage to NPN stage occurs 1 V below  $V^+$ . Because both input stages have their own offset voltage, the offset of the amplifier becomes a function of the input common-mode voltage and has a crossover point at 1 V below  $V^+$ .

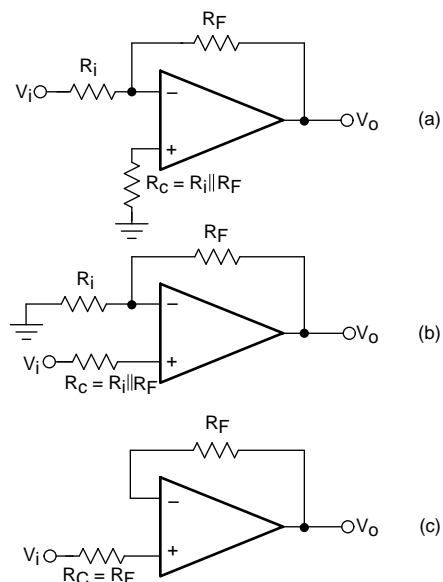

This  $V_{OS}$  crossover point can create problems for both DC- and AC-coupled signals if proper care is not taken. Large input signals that include the  $V_{OS}$  crossover point causes distortion in the output signal. One way to avoid such distortion is to keep the signal away from the crossover. For example, in a unity-gain buffer configuration and with  $V_S = 5$  V, a 5-V peak-to-peak signal contains input-crossover distortion while a 3-V peak-to-peak signal centered at 1.5 V does not contain input-crossover distortion as it avoids the crossover point. Another way to avoid large signal distortion is to use a gain of  $-1$  circuit which avoids any voltage excursions at the input terminals of the amplifier. In that circuit, the common-mode DC voltage can be set at a level away from the  $V_{OS}$  crossover point. For small signals, this transition in  $V_{OS}$  shows up as a  $V_{CM}$  dependent spurious signal in series with the input signal and can effectively degrade small signal parameters such as gain and common-mode rejection ratio. To resolve this problem, the small signal must be placed such that it avoids the  $V_{OS}$  crossover point. In addition to the rail-to-rail performance, the output stage can provide enough output current to drive 600- $\Omega$  loads. Because of the high current capability, take care to not exceed the 150°C maximum junction temperature specification.

## 7.4 Device Functional Modes

### 7.4.1 Input Bias Current Consideration

The LMV61x family has a complementary bipolar input stage. The typical input bias current ( $I_B$ ) is 15 nA. The input bias current can develop a significant offset voltage. This offset is primarily due to  $I_B$  flowing through the negative feedback resistor,  $R_F$ . For example, if  $I_B$  is 50 nA and  $R_F$  is 100 k $\Omega$ , then an offset voltage of 5 mV develops ( $V_{OS} = I_B \times R_F$ ). Using a compensation resistor ( $R_C$ ), as shown in Figure 28, cancels this effect. But the input offset current ( $I_{OS}$ ) still contributes to an offset voltage in the same manner.

**Figure 28. Canceling Offset Voltage Due to Input Bias Current**

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

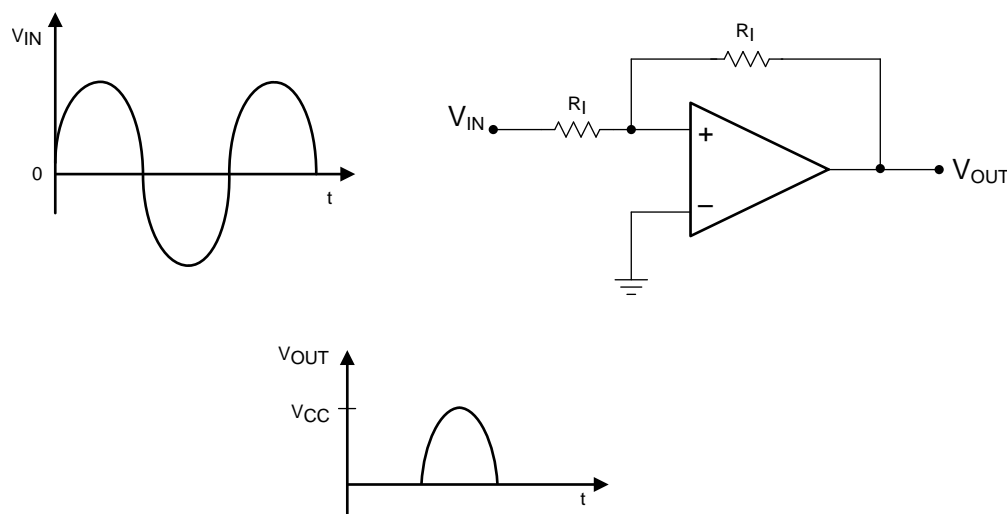

### 8.1 Application Information

The LMV61x devices bring performance, economy, and ease-of-use to low-voltage, low-power systems. They provide rail-to-rail input and rail-to-rail output swings into heavy loads.

#### 8.1.1 Half-Wave Rectifier With Rail-to-Ground Output Swing

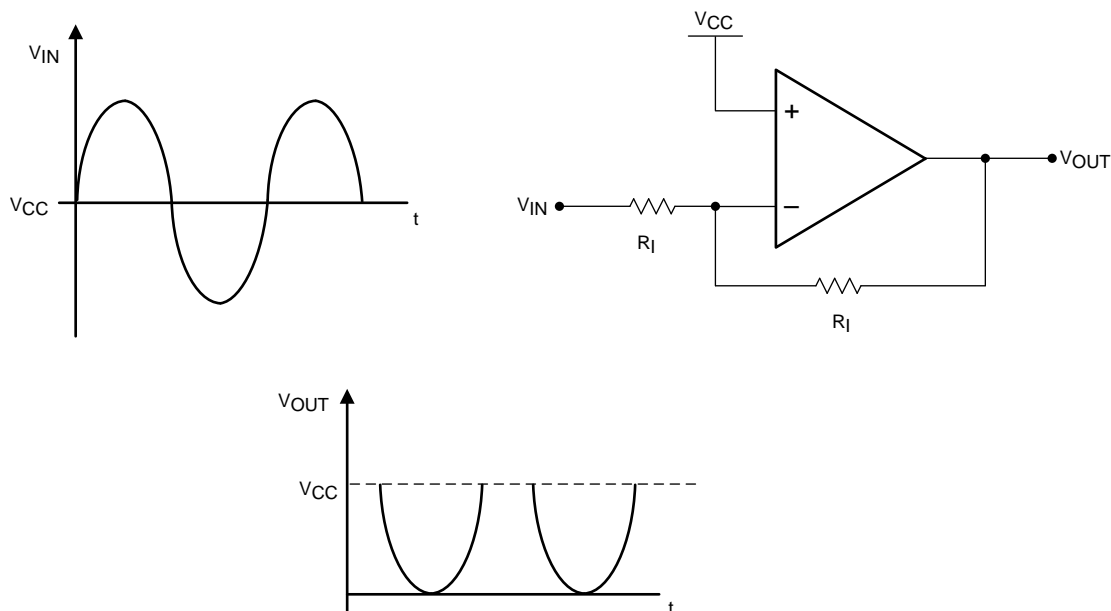

Because the LMV61x input common-mode range includes both positive and negative supply rails and the output can also swing to either supply, achieving half-wave rectifier functions in either direction is an easy task. All that is needed are two external resistors; there is no need for diodes or matched resistors. The half wave rectifier can have either positive or negative going outputs, depending on the way the circuit is arranged.

In [Figure 29](#) the circuit is referenced to ground, while in [Figure 30](#) the circuit is biased to the positive supply. These configurations implement the half-wave rectifier because the LMV61x can not respond to one-half of the incoming waveform. It can not respond to one-half of the incoming because the amplifier can not swing the output beyond either rail. Therefore, the output disengages during this half cycle. During the other half cycle, however, the amplifier achieves a half wave that can have a peak equal to the total supply voltage.  $R_I$  must be large enough not to load the LMV61x.

**Figure 29. Half-Wave Rectifier With Rail-to-Ground Output Swing Referenced to Ground**

## Application Information (continued)

**Figure 30. Half-Wave Rectifier With Negative-Going Output Referenced to  $V_{CC}$**

### 8.1.2 Instrumentation Amplifier With Rail-to-Rail Input and Output

Some manufactures make rail-to-rail op amps out of op amps that are otherwise non-rail-to-rail by using a resistive divider on the inputs. The resistors divide the input voltage to get a rail-to-rail input range. The problem with this method is that it also divides the signal, so to get the obtained gain, the amplifier must have a higher closed-loop gain. This raises the noise and drift by the internal gain factor and lowers the input impedance. Any mismatch in these precision resistors reduces the CMRR, as well. The LMV61x is rail-to-rail and therefore doesn't have these disadvantages.

Using three of the LMV61x amplifiers, an instrumentation amplifier with rail-to-rail inputs and outputs can be made as shown in [Figure 31](#).

In this example, amplifiers on the left side act as buffers to the differential stage. These buffers assure that the input impedance is very high and require no precision matched resistors in the input stage. They also assure that the difference amp is driven from a voltage source. This is necessary to maintain the CMRR set by the matching  $R_1$ - $R_2$  with  $R_3$ - $R_4$ . The gain is set by the ratio of  $R_2/R_1$  and  $R_3$  must equal  $R_1$  and  $R_4$  equal  $R_2$ . With both rail-to-rail input and output ranges, the input and output are only limited by the supply voltages. Remember that even with rail-to-rail outputs, the output can not swing past the supplies so the combined common-mode voltages plus the signal must not be greater that the supplies or limiting occurs.

## Application Information (continued)

**Figure 31. Rail-to-Rail Instrumentation Amplifier**

## 8.2 Typical Applications

### 8.2.1 High-Side Current Sensing

$$V_{OUT} = \frac{R_{SENSE} \cdot R_3}{R_1} \cdot I_{CHARGE} = 1 \Omega \cdot I_{CHARGE}$$

Copyright © 2016, Texas Instruments Incorporated

**Figure 32. High-Side, Current-Sensing Schematic**

#### 8.2.1.1 Design Requirements

The high-side, current-sensing circuit (Figure 32) is commonly used in a battery charger to monitor charging current to prevent overcharging. A sense resistor  $R_{SENSE}$  is connected to the battery directly. This system requires an op amp with rail-to-rail input. The LMV61x are ideal for this application because its common-mode input range goes up to the rail.

#### 8.2.1.2 Detailed Design Procedure

As seen in (Figure 32), the  $I_{CHARGE}$  current flowing through sense resistor  $R_{SENSE}$  develops a voltage drop equal to  $V_{SENSE}$ . The voltage at the negative sense point is now less than the positive sense point by an amount proportional to the  $V_{SENSE}$  voltage.

## Typical Applications (continued)

The low-bias currents of the LMV61x cause little voltage drop through  $R_2$ , so the negative input of the LMV61x amplifier is at essentially the same potential as the negative sense input.

The LMV61x detects this voltage error between its inputs and servo the transistor base to conduct more current through Q1, increasing the voltage drop across  $R_1$  until the LMV61x inverting input matches the noninverting input. At this point, the voltage drop across  $R_1$  now matches  $V_{SENSE}$ .

$I_G$ , a current proportional to  $I_{CHARGE}$ , flows according to Equation 1.

$$I_G = V_{RSENSE} / R_1 = (R_{SENSE} \times I_{CHARGE}) / R_1 \quad (1)$$

$I_G$  also flows through the gain resistor  $R_3$  developing a voltage drop equal to Equation 2.

$$V_3 = I_G \times R_3 = (V_{RSENSE} / R_1) \times R_3 = ((R_{SENSE} \times I_{CHARGE}) / R_2) \times R_3 \quad (2)$$

$$V_{OUT} = (R_{SENSE} \times I_{CHARGE}) \times G$$

where

$$G = R_3 / R_1 \quad (3)$$

The other channel of the LMV61x may be used to buffer the voltage across  $R_3$  to drive the following stages.

### 8.2.1.2.1 Application Curve

**Figure 33. High-Side, Current-Sensing Results**

## 9 Power Supply Recommendations

For proper operation, the power supplies must be properly decoupled. For decoupling the supply lines, TI recommends that 10-nF capacitors be placed as close as possible to the op amp power supply pins. For single-supply, place a capacitor between  $V^+$  and  $V^-$  supply leads. For dual supplies, place one capacitor between  $V^+$  and ground, and one capacitor between  $V^-$  and ground.

## 10 Layout

### 10.1 Layout Guidelines

To properly bypass the power supply, several locations on a printed-circuit board must be considered. A 6.8- $\mu$ F or greater tantalum capacitor must be placed at the point where the power supply for the amplifier is introduced onto the board. Another 0.1- $\mu$ F ceramic capacitor must be placed as close as possible to the power supply pin of the amplifier. If the amplifier is operated in a single power supply, only the  $V^+$  pin must be bypassed with a 0.1- $\mu$ F capacitor. If the amplifier is operated in a dual power supply, both  $V^+$  and  $V^-$  pins must be bypassed.

It is good practice to use a ground plane on a printed-circuit board to provide all components with a low inductive ground connection.

## Layout Guidelines (continued)

TI recommends surface-mount components in 0805 size or smaller in the LMV611-N application circuits. Designers can take advantage of the VSSOP miniature sizes to condense board layout to save space and reduce stray capacitance.

### 10.2 Layout Example

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

---

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4040047-5/M 06/11

NOTES:

- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
- D. Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
- E. Reference JEDEC MS-012 variation AB.

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4040064-3/G 02/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D (R-PDSO-G8)

PLASTIC SMALL OUTLINE

## NOTES:

- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- $\triangle C$  Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
- $\triangle D$  Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
- E. Reference JEDEC MS-012 variation AA.

DBV (R-PDSO-G5)

PLASTIC SMALL-OUTLINE PACKAGE

4073253-4/N 12/14

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
  - D. Falls within JEDEC MO-178 Variation AA.

DBV (R-PDSO-G5)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

DGK (S-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
