TEXAS INSTRUMENTS

LP2981 100-mA Ultra-Low Dropout Regulators With Shutdown

1 Features

- Output Tolerance of
  - 0.75% (A Grade)
  - 1.25% (Standard Grade)
- Ultra-Low Dropout Typically:
  - 200 mV at Full Load of 100 mA
  - 7 mV at 1 mA
- Low I_Q: 600 µA Typical at Full Load of 100 mA
- Shutdown Current: 0.01 µA Typical
- Fast Transient Response to Line and Load
- Overcurrent and Thermal Protection
- High Peak Current Capability
- Low Z_{OUT} Over Wide Frequency Range
- −40°C to 125°C Temperature Range

2 Applications

- Smart Meters
- Servo and Motor Control
- Mobile Phones and Cameras
- Audio and Portable Speakers
- Telecommunication and Networking

3 Description

The LP2981 and LP2981A families of fixed-output, low-dropout regulators offer exceptional, cost-effective performance for both portable and non-portable applications. Available in fixed voltages of 2.8 V, 3 V, 3.3 V, and 5 V, the family has an output tolerance of 0.75% for the A-grade devices (1.25% for the standard grade) and is capable of delivering 100-mA continuous load current. Standard regulator features, such as overcurrent and overtemperature protection, are included.

The LP2981 and LP2981A have features that make the regulators ideal candidates for a variety of portable applications:
- Low dropout: A PNP pass element allows a typical dropout of 200 mV at 100-mA load current and 7 mV at 1-mA load.
- Low quiescent current: The use of a vertical PNP process allows for quiescent currents that are considerably lower than those associated with traditional lateral PNP regulators.
- Shutdown: A shutdown feature is available, allowing the regulator to consume only 0.01 µA when the ON/OFF pin is pulled low.

Device Information[1]

PART NUMBER	PACKAGE (PINS)	BODY SIZE (NOM)
LP2981-XXDBV LP2981A-XXDBV	SOT-23 (5)	2.90 mm × 1.60 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Pin Configuration and Functions

DBV Package
5-Pin SOT-23
Top View

VIN	1	5	VOUT
GND	2		
ON/$\overline{\text{OFF}}$	3	4	NC

Not to scale

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V_{IN}	I	Supply input
2	GND	—	Ground
3	ON/$\overline{\text{OFF}}$	I	Active-low shutdown pin. Tie to V_{IN} if unused.
4	NC	—	No connect
5	V_{OUT}	O	Voltage output

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
V_{IN}	Continuous input voltage[2]	–0.3	16	V
$V_{ON/\overline{OFF}}$	ON/$\overline{\text{OFF}}$ input voltage	–0.3	16	V
V_{OUT}	Output voltage[3]	–0.3	9	V
I_{OUT}	Output current		Internally limited (short-circuit protected)	
T_J	Operating virtual junction temperature		150	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The PNP pass transistor has a parasitic diode connected between the input and output. This diode normally is reverse-biased (V_{IN} > V_{OUT}), but is forward-biased if the output voltage exceeds the input voltage by a diode drop (see *Application and Implementation* for more details).
(3) If load is returned to a negative power supply, the output must be diode clamped to GND.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±1000	
		Machine model (MM)	±200	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V_{IN}	Supply input voltage	2.2[1]	16	V
$V_{ON/\overline{OFF}}$	ON/$\overline{OFF}$ input voltage	0	V_{IN}	V
$V_{IN} - V_{OUT}$	Input-output differential	0.7	11	V
I_{OUT}	Output current		100	mA
T_J	Virtual junction temperature	−40	125	°C

(1)   Minimum V_{IN} of 2.2 V is needed for proper biasing of LDO control circuitry.

6.4 Thermal Information

	THERMAL METRIC[1]	LP2981-XX DBV (SOT-23) 5 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance [2][3]	205.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	11.83	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	37.7	°C/W
ψ_{JT}	Junction-to-top characterization parameter	12.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	33.8	°C/W

(1)   For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.
(2)   Maximum power dissipation is a function of $T_{J(max)}$, $R_{\theta JA}$, and T_A . The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_{J(max)} - T_A)/ R_{\theta JA}$. Operating at the absolute maximum T_J of 150°C can affect reliability.
(3)   The package thermal impedance is calculated in accordance with JESD 51-7.

6.5 Electrical Characteristics: LP2981-xx

at specified free-air temperature range, V_{IN} = $V_{OUT(NOM)}$ + 1 V, $V_{ON/\overline{OFF}}$ = 2 V, C_{IN} = 1 µF, I_L = 1 mA, C_{OUT} = 4.7 µF (unless otherwise noted)

PARAMETER		TEST CONDITIONS	T_A	MIN	TYP	MAX	UNIT
ΔV_{OUT}	Output voltage tolerance	I_L = 1 mA	25°C	−1.25		1.25	%V_{NOM}
		I_L = 1 mA to 100 mA	25°C	−2		2	
			−40°C to 125°C	−3.5		3.5	
$\Delta V_{OUT}/\Delta V_{IN}$	Output voltage line regulation	V_{IN} = ($V_{OUT(NOM)}$ + 1 V) to 16 V	25°C		0.007	0.014	%/V
			−40°C to 125°C			0.032	
$V_{IN} - V_{OUT}$	Dropout voltage[1]	I_L = 0	25°C		1	3	mV
			−40°C to 125°C			5	
		I_L = 1 mA	25°C		7	10	
			−40°C to 125°C			15	
		I_L = 25 mA	25°C		70	100	
			−40°C to 125°C			150	
		I_L = 100 mA	25°C		200	250	
			−40°C to 125°C			375	

(1)   Dropout voltage is defined as the input-to-output differential at which the output voltage drops 100 mV below the value measured with a 1-V differential. This dropout specification does not apply to the 1.8-V option, as the minimum V_{IN} = 2.2 V must be observed for proper biasing of LDO control circuitry.

6.7 Typical Characteristics

Unless otherwise specified: T_A = 25°C, V_{IN} = $V_{O(NOM)}$ + 1 V, C_{OUT} = 10 µF, C_{IN} = 1 µF all voltage options, ON/$\overline{OFF}$ pin tied to V_{IN}.

Figure 1. Load Regulation - LP2981-33

7 Detailed Description

7.1 Overview

The LP2981 and LP2981A are 100-mA fixed-output, low-dropout regulator. Available in assorted output voltages from 2.5 V to 5 V, the device has an output tolerance of 0.75% for the A grade (1.25% for the non-A version). The low-drop voltage and the ultra-low quiescent current make them suitable for low noise, low-power applications and in battery-powered systems:

- Low dropout: A PNP pass element allows a typical dropout of 200 mV at 100-mA load current and 7 mV at 1-mA load.
- Low quiescent current: The use of a vertical PNP process allows for quiescent currents that are considerably lower than those associated with traditional lateral PNP regulators.
- Shutdown: A shutdown feature is available, allowing the regulator to consume only 0.01 µA when the ON/OFF pin is pulled low.
- Small packaging: For the most space-constrained needs, the regulator is available in the SOT-23 package.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Ultra-Low Dropout Voltage

The dropout voltage often refers to the voltage difference between the input and output voltage ($V_{DO} = V_{IN} - V_{OUT}$), where the main current pass-FET is fully on in the ohmic region of operation and is characterized by the classic $R_{DS(ON)}$ of the FET. V_{DO} indirectly specifies a minimum input voltage above the nominal programmed output voltage at which the output voltage is expected to remain within its accuracy boundary. The LP2981's pass-PNP allows a dropout of 200 mV at full load and 7 mV at 1 mA or lower loads. This allows for small voltage drop regulation and reduces the total power dissipation.

7.3.2 Low Ground Current

LP2981 uses a vertical PNP process which allows for quiescent currents that are considerably lower than those associated with traditional lateral PNP regulators, typically 600 µA at 100-mA load and 65 µA at 1-mA load.

Feature Description (continued)

7.3.3 Short-Circuit Protection (Current Limit)

The internal current-limit circuit is used to protect the LDO against high-load current faults or shorting events. The LDO is not designed to operate in a steady-state current limit. During a current-limit event, the LDO sources constant current. Therefore, the output voltage falls when load impedance decreases. If a current limit occurs and the resulting output voltage is low, excessive power may be dissipated across the LDO resulting in a thermal shutdown of the output. A foldback feature limits the short-circuit current to protect the regulator from damage under all load conditions. If V_{OUT} is forced below 0 V before ON/$\overline{OFF}$ goes high and the load current required exceeds the foldback current limit, the device may not start up correctly.

7.3.4 Capacitor Characteristics

7.3.4.1 Ceramic

Due to their very low ESR values, ceramic capacitors are not suitable for use as the output capacitor. For instance, a typical 2.2-µF ceramic capacitor has an ESR in the range of 10 mΩ to 20 mΩ and, thus, easily can fall out of minimum ESR requirements under certain operating conditions.

If a ceramic capacitor is used at the output, a 1-Ω resistor must be placed in series with the capacitor to raise the ESR seen by the regulator.

7.3.4.2 Tantalum

Solid tantalum capacitors are optimal choices for the LP2981, but they still must meet the minimum ESR requirement. Note that the ESR of a tantalum capacitor increases as temperature drops, as much as doubling from 25°C to –40°C. Thus, ESR margins must be maintained over the temperature range to prevent regulator instability. For operation at very low temperatures, paralleling a tantalum capacitor with a ceramic one keeps the combined ESR from increasing near the upper limit of the ESR curve.

7.3.4.3 Aluminum

Aluminum capacitors can be used, but use with the LP2981 is impractical due to their large physical dimensions. They also must meet the ESR requirements over the full temperature range. In this regard, aluminium capacitors are at a big disadvantage due to their sharp ESR increase as temperature drops. For example, over a temperature drop from 20°C to –40°C, the ESR of an aluminum electrolytic capacitor can increase by a factor of 50. In addition, some of the electrolytes used in these capacitors can freeze at –25°C, making the capacitor nonoperational.

7.4 Device Functional Modes

7.4.1 ON/OFF Operation

The LP2981 allows for a shutdown mode through the ON/OFF pin. If the shutdown feature is not used, ON/OFF must be connected to the input to ensure that the regulator is on at all times. To drive ON/OFF:

- A LOW (≤0.3 V) turns the regulator OFF; a HIGH (≥1.6 V) turns it ON.
  - Use either a totem-pole output or an open-collector output with a pullup resistor tied to V_{IN} (or another logic supply)
- The HIGH signal can exceed VIN, but must not exceed the absolute maximum ratings of 20 V for the ON/OFF pin
- Apply a signal with a slew rate of ≥40 mV/µs. A slow slew rate can cause the shutdown function to operate incorrectly

7.4.2 Reverse Input-Output Voltage

An inherent diode is present across the PNP pass element of the LP2981.
Figure 2. Internal PNP Diode Structure

With the anode connected to the output, this diode is reverse-biased during normal operation, because the input voltage is higher than the output. However, if the output is pulled one V_{BE} higher than the input, or if the input is abruptly stepped below the output, this diode is forward-biased and can cause a parasitic silicon-controlled rectifier (SCR) to latch, resulting in current flowing from the output to the input (values in excess of 100 mA can cause damage). Thus, to prevent possible damage to the regulator in any application where the output may be pulled above the input, an external Schottky diode must be connected between the output and input. With the anode on output, this Schottky limits the reverse voltage across the output and input pins to approximately 0.3 V, preventing the regulator's internal diode from forward biasing.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LP2981 is a linear voltage regulator operating from 2.1 V to 16 V on the input and regulates voltages between 2.5 V to 5 V with 0.75% accuracy and 100-mA maximum output current. Efficiency is defined by the ratio of output voltage to input voltage because the LP2981 is a linear voltage regulator. To achieve high efficiency, the dropout voltage ($V_{IN} - V_{OUT}$) must be as small as possible, thus requiring a very-low-dropout LDO. Successfully implementing an LDO in an application depends on the application requirements. If the requirements are simply input voltage and output voltage, compliance specifications (such as internal power dissipation or stability) must be verified to ensure a solid design. If timing, start-up, noise, power supply rejection ratio (PSRR), or any other transient specification is required, then the design becomes more challenging.

8.2 Typical Application
Copyright © 2016, Texas Instruments Incorporated

A. Minimum C_{OUT} value for stability (can be increased without limit for improved stability and transient response)

B. ON/$\overline{OFF}$ must be actively terminated. Connect to V_{IN} if shutdown feature is not used.

C. Pin 4 (NC) must be left open. Do not connect anything to this pin.

Figure 4. LP2981 Typical Application

8.2.1 Design Requirements

Table 1 lists the parameters for this application.

Table 1. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	5 V ±10%, provided by an external regulator
Output voltage	3.3 V ±5%
Output current	100 mA (maximum), 1 mA (minimum)
RMS noise, 300 Hz to 50kHz	< 1 mV$_{RMS}$
PSRR at 1kHz	> 40 dB

8.2.2 Detailed Design Procedure

8.2.2.1 External Capacitors

Like any low-dropout regulator, the external capacitors used with the LP2981 must be carefully selected to assure regulator loop stability.

8.2.2.1.1 Input Capacitor (C_{in})

A minimum value of 1 µF (over the entire operating temperature range) is required at the input of the LP2981. In addition, this input capacitor must be placed within 1 cm of the input pin and connected to a clean analog ground. There is no Equivalent Series Resistance (ESR) requirement for this capacitor, and the capacitance can be increased without limit. A good-quality ceramic or tantalum capacitor can be used.

8.2.2.1.2 Output Capacitor (C_{out})

As a PNP regulator, the LP2981 requires the output capacitor to meet both a minimum capacitance and ESR value. Required ESR values as a function of load current are provided for various output voltages, load currents, and capacitances (see Figure 5 through Figure 8).
- Minimum C_{out}: 3.3 µF (can be increased without limit to improve transient response stability margin)
- ESR range: see Figure 5 through Figure 8

It is critical that both the minimum capacitance and ESR requirement be met over the entire operating temperature range. Depending on the type of capacitor used, both of these parameters can vary significantly with temperature (see *Capacitor Characteristics*).

8.2.3 Application Curves

SLVS521G –JULY 2004–REVISED AUGUST 2016

TEXAS INSTRUMENTS

www.ti.com
9 Power Supply Recommendations

The LP2981 is designed to operate from an input voltage supply range between 2.2 V and 16 V. The input voltage range provides adequate headroom for the device to have a regulated output. This input supply must be well regulated. If the input supply is noisy, additional input capacitors with low ESR can help improve the output noise performance.

10 Layout

10.1 Layout Guidelines

For best overall performance, place all circuit components on the same side of the printed-circuit board and as near as practical to the respective LDO pin connections. Place ground return connections to the input and output capacitors, and to the LDO ground pin as close to each other as possible, connected by a wide, component-side, copper surface. The use of vias and long traces to create LDO circuit connections is strongly discouraged and negatively affects system performance. This grounding and layout scheme minimizes inductive parasitics, and thereby reduces load-current transients, minimizes noise, and increases circuit stability. A ground reference plane is also recommended and is either embedded in the PCB itself or located on the bottom side of the PCB opposite the components. This reference plane serves to assure accuracy of the output voltage, shield noise, and behaves similar to a thermal plane to spread (or sink) heat from the LDO device. In most applications, this ground plane is necessary to meet thermal requirements.

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

DBV (R−PDSO−G5) PLASTIC SMALL−OUTLINE PACKAGE

4073253−4/N 12/14

NOTES: A. All linear dimensions are in millimeters.
  B. This drawing is subject to change without notice.
  C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
  D. Falls within JEDEC MO−178 Variation AA.

NOTES: A.   All linear dimensions are in millimeters.
         B.   This drawing is subject to change without notice.
         C.   Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
         D.   Publication IPC−7351 is recommended for alternate designs.
         E.   Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should
              contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric
              metal load solder paste. Refer to IPC−7525 for other stencil recommendations.
