

LP2989LV Micropower and Low-Noise, 500-mA Ultra Low-Dropout Regulator for Use With Ceramic Output Capacitors

1 Features

- 2.1-V to 16-V Input Voltage Range
- Ultra-Low Dropout Voltage
- 500-mA Continuous Output Current
- Very Low Output Noise With External Capacitor
- < 0.8- μ A Quiescent Current When Shut Down
- Low Ground Pin Current at All Loads
- 0.75% Output Voltage Accuracy (A Grade)
- High Peak Current Capability (800-mA typical)
- Overtemperature and Overcurrent Protection
- -40°C to +125°C Junction Temperature Range

2 Applications

- Notebooks and Desktop PCs
- PDAs and Palmtop Computers
- Wireless Communication Pins
- SMPS Post-Regulators

3 Description

The LP2989LV is a fixed-output 500-mA precision LDO regulator designed for use with ceramic output capacitors.

Output noise can be reduced to 18 μ V (typical) by connecting an external 10-nF capacitor to the bypass pin.

Using an optimized Vertically Integrated PNP (VIP) process, the LP2989LV delivers superior performance:

Ground Pin Current: Typically 3 mA at 500-mA load, and 110 μ A at 100- μ A load.

Sleep Mode: The LP2989LV draws less than 0.8- μ A quiescent current when **SHUTDOWN** pin is pulled low.

ERROR Flag: The built-in **ERROR** flag goes low when the output drops approximately 5% below nominal.

Precision Output: Output voltage accuracy is 0.75% (A grade) and 1.25% (standard grade) at room temperature.

For output voltages greater than or equal to 2 V, see the LP2989 ([SNVS083](#)) data sheet.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LP2989LV	WSON (8)	4.00 mm x 4.00 mm
	SOIC (8)	4.90 mm x 3.91 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Typical Application

*Capacitance values shown are minimum required to assure stability, but may be increased without limit. Larger output capacitor provides improved dynamic response. See the [Output Capacitor](#) section.

**Shutdown must be actively terminated (see the [Shutdown Input Operation](#) section). Tie to IN (pin 4) if not use.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision J (April 2013) to Revision K	Page
• Changed "Wide Supply Voltage Range (16V Max)" to "2.1-V to 16-V Input Voltage Range" in <i>Features</i>	1
• Added <i>Handling Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section; add updated <i>Thermal Information</i> values; delete lead temperature from Ab Max (in POA); update pin names to TI nomenclature; removed reference to VSSOP package option (no longer available for this part number)	1
• Changed caption for Figure 11	8

Changes from Revision I (April 2013) to Revision J	Page
• Changed Changed layout of National data sheet to TI format	15

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NUMBER		
BYPASS	1	I	Bypass capacitor input
ERROR	7	O	Error signal output
GROUND	3	—	GND
INPUT	4	I	Regulator power input
N/C	2	—	DO NOT CONNECT. Device pin 2 is reserved for post packaging test and calibration of the LP2989LV V_{OUT} accuracy. Device pin 2 must be left floating. Do not connect to any potential. Do not connect to ground. Any attempt to do pin continuity testing on device pin 2 is discouraged. Continuity test results are variable depending on the actions of the factory calibration. Aggressive pin continuity testing (high voltage, or high current) on device pin 2 may activate the trim circuitry forcing V_{OUT} to move out of tolerance.
OUTPUT	5	O	Regulated output voltage
SENSE	6	I	Feedback voltage sense input
SHUTDOWN	8	I	Shutdown input
Thermal Pad	—	—	The exposed thermal pad on the bottom of the WSON package must be connected to a copper thermal pad on the PCB under the package. The use of thermal vias to remove heat from the package into the PCB is recommended. Connect the thermal pad to ground potential or leave floating. Do not connect the thermal pad to any potential other than the same ground potential seen at device pin 3. For additional information on using TI's Non Pull Back WSON package, see Application Note AN-1187 <i>Leadless Leadframe Package (LLP)</i> (SNOA401).

6 Specifications

6.1 Absolute Maximum Ratings

If Military/Aerospace specified devices are required contact the Texas Instruments Sales Office/Distributors for availability and specifications.⁽¹⁾

	MIN	MAX	UNIT
Operating junction temperature	–40	125	°C
Power dissipation ⁽²⁾	Internally limited		
Input supply voltage, survival	–0.3	16	V
SENSE pin	–0.3	6	V
Output voltage, survival ⁽³⁾	–0.3	16	V
I _{OUT} , Survival	Short-circuit protected		
Input-output voltage, survival ⁽⁴⁾	–0.3	16	V
Storage temperature range, T _{stg}	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The maximum allowable power dissipation is a function of the maximum junction temperature, T_{J(MAX)}, the junction-to-ambient thermal resistance, R_{θJA}, and the ambient temperature, T_A. The maximum allowable power dissipation at any ambient temperature is calculated using: P_(MAX) = (T_{J(MAX)} – T_A) / R_{θJA}. The value R_{θJA} for the WSON (NGN) package is specifically dependent on PCB trace area, trace material, and the number of layers and thermal vias. For improved thermal resistance and power dissipation for the WSON package, refer to Application Note AN-1187 *Leadless Leadframe Package (LLP)* (SNOA401). Exceeding the maximum allowable power dissipation causes excessive die temperature, and the regulator goes into thermal shutdown.
- (3) If used in a dual-supply system where the regulator load is returned to a negative supply, the LP2989LV output must be diode-clamped to ground.
- (4) The output PNP structure contains a diode between the IN and OUT pins that is normally reverse-biased. Forcing the output above the input turns on this diode and may induce a latch-up mode which can damage the part.

6.2 ESD Ratings

	VALUE	UNIT
V _(ESD) Electrostatic discharge Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Operating junction temperature	–40	125	°C
Operating input supply voltage	2.1	16	V

7 Detailed Description

7.1 Overview

The LP2989LV device is a very high-accuracy micro-power voltage regulator with low quiescent current (75 μ A typical) and low dropout voltage (typical 40 mV at light loads and 380 mV at 100 mA). It is ideally suited for use in battery-powered systems. The LP2989LV block diagram contains several features, including:

- Very high-accuracy 1.23-V reference
- SHUTDOWN input
- ERROR flag output
- Internal protection circuitry, such as foldback current limit, and thermal shutdown.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 High-Accuracy Output Voltage

With special careful design to minimize all contributions to the output voltage error, the LP2989LV distinguishes itself as a very high output-voltage-accuracy micropower LDO. This includes a tight initial tolerance (0.75% typical, A grade), extremely good line regulation (0.005%/V typical), and a very low output-noise voltage (10 μ V_{RMS} typical), making the device an ideal low-power voltage reference.

7.3.2 Sleep Mode

When pulling SHUTDOWN pin to low levels, the LP2989LV enters shutdown mode, and a very low quiescent current is consumed. This function is designed for applications which needs a shutdown mode to effectively enhance battery life cycle.

7.3.3 Error Detection Comparator Output

The LP2989LV generates a logic low output whenever its output falls out of regulation by more than approximately 5%. Refer to [Application and Implementation](#) for more details.

7.3.4 Short Circuit Protection (Current Limit)

The internal current limit circuit is used to protect the LDO against high-load current faults or shorting events. The LDO is not designed to operate in a steady-state current limit. During a current-limit event, the LDO sources constant current. Therefore, the output voltage falls when load impedance decreases. Note also that if a current limit occurs and the resulting output voltage is low, excessive power may be dissipated across the LDO, resulting in a thermal shutdown of the output. A foldback feature limits the short-circuit current to protect the regulator from damage under all load conditions. If OUT is forced below 0 V before EN goes high and the load current required exceeds the foldback current limit, the device may not start correctly.

Feature Description (continued)

7.3.5 Thermal Protection

The device contains a thermal shutdown protection circuit to turn off the output current when excessive heat is dissipated in the LDO. The thermal time-constant of the semiconductor die is fairly short, and thus the output cycles on and off at a high rate when thermal shutdown is reached until the power dissipation is reduced. The internal protection circuitry of the device is designed to protect against thermal overload conditions. The circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown degrades its reliability.

7.4 Device Functional Modes

7.4.1 Operation With $16\text{ V} \geq V_{\text{IN}} > V_{\text{OUT(TARGET)}} + 1\text{ V}$

The device operates if the input voltage is equal to, or exceeds $V_{\text{OUT(TARGET)}} + 1\text{ V}$. At input voltages below the minimum V_{IN} requirement, the device does not operate correctly, and output voltage may not reach target value.

7.4.2 Operation with Shutdown Control

If the voltage on the $\overline{\text{SHUTDOWN}}$ pin is less than 0.18 V, the output is ensured to be OFF. When the voltage on the $\overline{\text{SHUTDOWN}}$ pin is more than 1.6 V the output is ensured to be ON. Operating with the $\overline{\text{SHUTDOWN}}$ pin voltage between 0.18 V and 1.6 V is strongly discouraged as the status of the output is not ensured.

7.4.3 Shutdown Input Operation

The LP2989LV is shut off by driving the $\overline{\text{SHUTDOWN}}$ pin low, and turned on by pulling it high. If this feature is not to be used, the $\overline{\text{SHUTDOWN}}$ must be tied to V_{IN} to keep the regulator output on at all times.

To assure proper operation, the signal source used to drive the Shutdown input must be able to swing above and below the specified turn-on/turn-off voltage thresholds listed in [Electrical Characteristics](#) under V_{SD} .

To prevent mis-operation, the turnon (and turnoff) voltage signals applied to the $\overline{\text{SHUTDOWN}}$ input must have a slew rate which is $\geq 40\text{ mV}/\mu\text{s}$.

CAUTION

The regulator output voltage **cannot** be ensured if a slow-moving AC (or DC) signal is applied that is in the range between the specified turn-on and turn-off voltages listed under the electrical specification V_{SD} (see [Electrical Characteristics](#)).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LP2989LV is a linear voltage regulator operating from 2.1 V to 16 V on the input and regulates voltages between 2.5 V to 5 V with 0.75% accuracy and 500-mA maximum output current. Efficiency is defined by the ratio of output voltage to input voltage because the LP2989LV is a linear voltage regulator. To achieve high efficiency, the dropout voltage ($V_{IN} - V_{OUT}$) must be as small as possible, thus requiring a very low dropout LDO. Successfully implementing an LDO in an application depends on the application requirements. If the requirements are simply input voltage and output voltage, compliance specifications (such as internal power dissipation or stability) must be verified to ensure a solid design. If timing, start-up, noise, PSRR, or any other transient specification is required, the design becomes more challenging.

8.2 Typical Application

*Capacitance values shown are minimum required to assure stability, but may be increased without limit. Larger output capacitor provides improved dynamic response. See the [Output Capacitor](#) section.

** $\overline{S/D}$ must be actively terminated (see the [Shutdown Input Operation](#) section). Tie to IN (pin 4) if not use.

Figure 12. Typical Application Schematic

8.2.1 Design Requirements

For typical linear regulator applications, use the parameters in [Table 1](#)

Table 1. Design Parameters

DESIGN PARAMETER	DESIGN REQUIREMENT
Input voltage	6.5 V, $\pm 10\%$,
Output voltage	5 V, $\pm 1\%$
Output current	500 mA (maximum), 1 mA (minimum)
RMS noise, 100 Hz to 100 kHz	18 $\mu V_{(RMS)}$ typical
PSRR at 1 kHz	60 dB typical

8.2.2 Detailed Design Procedure

At 500-mA loading, the dropout of the LP2989LV has 650-mV maximum dropout over temperature, thus an 1500-mV headroom is sufficient for operation over both input and output voltage accuracy. The efficiency of the LP2989LV in this configuration is $V_{OUT} / V_{IN} = 76.9\%$. To achieve the smallest form factor, the WSON package is selected. Input and output capacitors are selected in accordance with the capacitor recommendations. Ceramic capacitances of 2.2 μF for the input and one 4.7- μF capacitor for the output are selected. With an efficiency of 76.9% and a 500-mA maximum load, the internal power dissipation is 750 mW, which corresponds to a 26.1°C junction temperature rise for the WSON package. With an 85°C maximum ambient temperature, the junction temperature is at 111.1°C. To minimize noise, a bypass capacitance (C_{BYPASS}) of 0.01 μF is placed from the BYPASS pin (device pin 1) to device ground (device pin 3).

8.2.2.1 WSON Package Devices

The LP2989LV is offered in the 8-lead WSON surface mount package to allow for increased power dissipation compared to the SOIC package. For details on thermal performance as well as mounting and soldering specifications, refer to Application Note AN-1187 *Leadless Leadframe Package (LLP)* ([SNOA401](#)).

For output voltages $\geq 2\text{ V}$, see LP2989LV ([SNVS083](#)) data sheet.

8.2.2.2 External Capacitors

Like any low-dropout regulator, the LP2989LV requires external capacitors for regulator stability. These capacitors must be correctly selected for good performance.

8.2.2.2.1 Input Capacitor

An input capacitor whose value is at least 2.2 μF is required between the LP2989LV input and ground (the amount of capacitance may be increased without limit).

Characterization testing performed on the LP2989LV has shown that if the value of actual input capacitance drops below about 1.5 μF , an unstable operating condition may result. Therefore, the next larger standard size (2.2 μF) is specified as the minimum required input capacitance. Capacitor tolerance and temperature variation must be considered when selecting a capacitor (see [Capacitor Characteristics](#) section) to assure the minimum requirement of 1.5 μF is met over all operating conditions.

The input capacitor must be located at a distance of not more than 0.5 inches from the input pin and returned to a clean analog ground. Any good quality ceramic or tantalum may be used for this capacitor, assuming the minimum capacitance requirement is met.

8.2.2.2.2 Output Capacitor

The LP2989LV requires a ceramic output capacitor whose value is at least 10 μF . The actual amount of capacitance on the output must never drop below about 7 μF or unstable operation may result. For this reason, capacitance tolerance and temperature characteristics must be considered when selecting an output capacitor.

The LP2989LV is designed specifically to work with ceramic output capacitors, using circuitry which allows the regulator to be stable across the entire range of output current with an output capacitor whose ESR is as low as 4 m Ω . It may also be possible to use Tantalum or film capacitors at the output, but these are not as attractive for reasons of size and cost (see [Capacitor Characteristics](#)).

The output capacitor must meet the requirement for minimum amount of capacitance and also have an equivalent series resistance (ESR) value which is within the stable range. Curves are provided which show the stable ESR range as a function of load current (see [Figure 13](#)).

Figure 13. Stable Region for Output Capacitor ESR

NOTE

Important: The output capacitor must maintain its ESR within the stable region over the full operating temperature range of the application to assure stability.

It is important to remember that capacitor tolerance and variation with temperature must be considered when selecting an output capacitor so that the minimum required amount of output capacitance is provided over the full operating temperature range. (See [Capacitor Characteristics](#).)

The output capacitor must be located not more than 0.5 inches from the OUT pin and returned to a clean analog ground.

8.2.2.2.3 Noise Bypass Capacitor

Connecting a 10-nF capacitor to the BYPASS pin significantly reduces noise on the regulator output. However, the capacitor is connected directly to a high-impedance circuit in the bandgap reference.

Because this circuit has only a few microamperes flowing in it, any significant loading on this node causes the regulated output voltage to drop. For this reason, DC leakage current through the noise bypass capacitor must never exceed 100 nA, and must be kept as low as possible for best output voltage accuracy.

The types of capacitors best suited for the noise bypass capacitor are ceramic and film. High-quality ceramic capacitors with either NPO or COG dielectric typically have very low leakage. 10-nF polypropylene and polycarbonate film capacitors are available in small surface-mount packages and typically have extremely low leakage current.

8.2.2.3 Capacitor Characteristics

8.2.2.3.1 Ceramic

The LP2989LV was designed to work with ceramic capacitors on the output to take advantage of the benefits they offer: for capacitance values in the 10 μ F range, ceramics are the least expensive and also have the lowest ESR values (which makes them best for eliminating high-frequency noise). The ESR of a typical 10- μ F ceramic capacitor is in the range of 5 m Ω to 10 m Ω , which easily meets the ESR limits required for stability by the LP2989LV.

One disadvantage of ceramic capacitors is that their capacitance can vary with temperature. Many large-value ceramic capacitors ($\geq 2.2 \mu$ F) are manufactured with the Z5U or Y5V temperature characteristic, which results in the capacitance dropping by more than 50% as the temperature goes from 25°C to 85°C.

This could cause problems if a 10- μ F Y5V capacitor were used on the output because it drops down to approximately 5 μ F at high ambient temperatures (which could cause the LP2989LV to oscillate). Another significant problem with Z5U and Y5V dielectric devices is that the capacitance drops severely with applied voltage. A typical Z5U or Y5V capacitor can lose 60% of its rated capacitance with half of the rated voltage applied to it.

For these reasons, X7R and X5R type ceramic capacitors must be used on the input and output of the LP2989LV.

LP2989LV

SNVS086K –MAY 2000–REVISED JULY 2015

www.ti.com

8.2.2.3.2 Tantalum

Tantalum output capacitors are not recommended for use with the LP2989LV; they are less desirable than ceramics for use as output capacitors because they are typically more expensive when comparing equivalent capacitance and voltage ratings in the 1 μF to 10 μF range

Another important consideration is that tantalum capacitors have higher ESR values than equivalent size ceramics; while it may be possible to find a Tantalum capacitor with an ESR value within the stable range, it would have to be larger in capacitance (which means bigger and more costly) than a ceramic capacitor with the same ESR value.

Most 10- μF tantalum capacitors have ESR values higher than 0.5 Ω maximum limit required to make the LP2989LV stable. Also note that the ESR of a typical tantalum increases about 2:1 as the temperature goes from 25°C down to -40°C, so some guard band must be allowed.

8.2.2.3.3 Film

Polycarbonate and polypropylene film capacitors have excellent electrical performance: their ESR is the lowest of the three types listed, their capacitance is very stable with temperature, and DC leakage current is extremely low.

One disadvantage is that film capacitors are larger in physical size than ceramic or tantalum which makes film a poor choice for either input or output capacitors.

However, their low leakage makes them a good choice for the noise bypass capacitor. Because the required amount of capacitance is only 0.01 μF , small surface-mount film capacitors are available in this size.

8.2.2.4 Reverse Input-Output Voltage

The PNP power transistor used as the pass element in the LP2989LV has an inherent diode connected between the regulator output and input.

During normal operation (where the input voltage is higher than the output) this diode is reverse-biased.

However, if the output is pulled above the input, this diode turns on, and current flows into the regulator output.

In such cases, a parasitic SCR can latch which allows high current to flow into V_{IN} can damage the part.

In any application where the output may be pulled above the input, an external Schottky diode must be connected from V_{IN} to V_{OUT} (cathode on V_{IN} , anode on V_{OUT}), to limit the reverse voltage across the LP2989LV to 0.3 V (see [Absolute Maximum Ratings](#)).

8.2.3 Application Curves

Figure 14. Line Transient Response

Figure 15. Load Transient Response

9 Power Supply Recommendations

The LP2989LV is designed to operate from an input voltage supply range from 2.1 V to 16 V. The input voltage range provides adequate headroom for the device to have a regulated output. This input supply must be well regulated. If the input supply is noisy, additional input capacitors with low ESR can help improve the output noise performance.

10 Layout

10.1 Layout Guidelines

For best overall performance, place all circuit components on the same side of the circuit board and as near as practical to the respective LDO pin connections. Place ground return connections to the input and output capacitor, and to the LDO ground pin as close to each other as possible, connected by a wide, component-side, copper surface. The use of vias and long traces to create LDO circuit connections is strongly discouraged and negatively affects system performance. This grounding and layout scheme minimizes inductive parasitics, and thereby reduces load-current transients, minimizes noise, and increases circuit stability. A ground reference plane is also recommended and is either embedded in the PCB itself or located on the bottom side of the PCB opposite the components. This reference plane serves to assure accuracy of the output voltage, shield noise, and behaves similarly to a thermal plane to spread (or sink) heat from the LDO device. In most applications, this ground plane is necessary to meet thermal requirements.

10.2 Layout Example

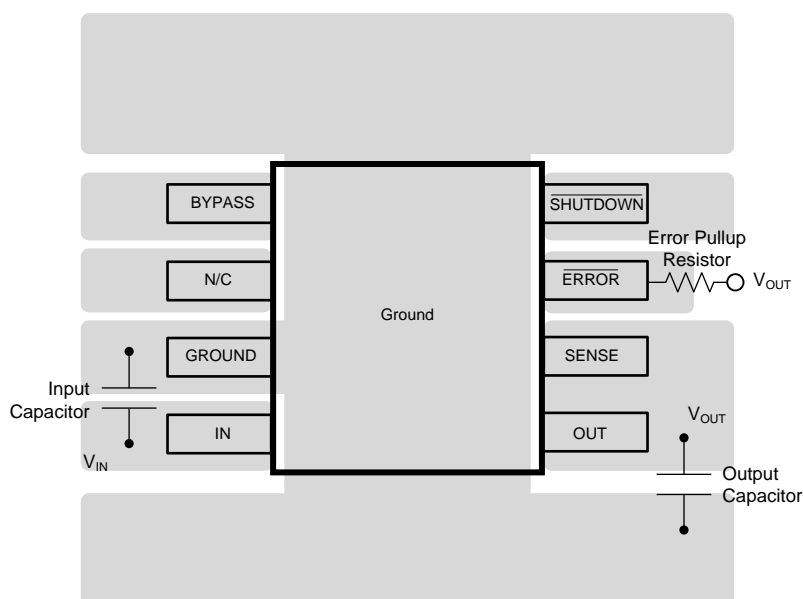

Figure 16. LP2989LV Layout Example

10.2.1 Thermal Considerations

CAUTION

Due to the limited power dissipation characteristics of the available SOIC (D) and WSON (NGN) packages, all possible combinations of output current (I_{OUT}), input voltage (V_{IN}), and ambient temperatures (T_A) cannot be ensured.

Power dissipation, P_D is calculated from the following formula:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (1)$$

The LP2989LV regulator has internal thermal limiting designed to protect the device during overload conditions. For continuous normal conditions, the recommended maximum operating junction temperature is 125°C. It is important to give careful consideration to all sources of thermal resistance from junction to ambient. Additional heat sources mounted nearby must also be considered.

For surface-mount devices, heat sinking is accomplished by using the heat-spreading capabilities of the PC board and its copper traces. Copper board stiffeners and plated through-holes can also be used to spread the heat generated by power devices.

Layout Example (continued)

Example: Given an output voltage of 1.8 V, an input voltage range of 4 V to 6 V, a maximum output current of 100 mA, and a maximum ambient temperature of 50°C, what is the maximum operating junction temperature? The maximum power dissipated by the device ($P_{D(MAX)}$) is found using the formula in [Equation 2](#):

$$P_{D(MAX)} = (V_{IN(MAX)} - V_{OUT}) \times I_{OUT(MAX)} \quad (2)$$

Using [Equation 2](#), the result is:

$$P_{D(MAX)} = ((6 \text{ V} - 1.8 \text{ V}) \times 100 \text{ mA}) = 0.42 \text{ W}$$

when

- $I_{OUT(MAX)} = 100 \text{ mA}$
- $V_{IN(MAX)} = 6 \text{ V}$
- $V_{OUT} = 1.8 \text{ V}$

Using the 8-pin SOIC (D) package, the LP2989LV junction-to-ambient thermal resistance ($R_{\theta JA}$) has a rating of 114.5°C/W using the standard JEDEC JESD51-7 PCB (High-K) circuit board.

$$T_{RISE} = P_{D(MAX)} \times R_{\theta JA} \quad (3)$$

Thus, The junction temperature rise above ambient (T_{RISE}) using the formula in [Equation 3](#) is:

$$T_{RISE} = 0.42 \text{ W} \times 114.5^\circ\text{C/W} = 48.1^\circ\text{C}$$

The junction temperature rise can then be added to the maximum ambient temperature to find the estimated operating junction temperature (T_J) using the formula in [Equation 4](#):

$$T_{J(MAX)} = T_{A(MAX)} + T_{RISE} \quad (4)$$

which gives the following results:

$$T_{J(MAX)} = 50^\circ\text{C} + 48.1^\circ\text{C} = 98.1^\circ\text{C}$$

11 Device and Documentation Support

11.1 Documentation Support

11.1.1 Related Documentation

For related documentation see the following:

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
