

TPS6105x 1.2-A High-Power White LED Driver 2-MHz Synchronous Boost Converter With I²C Compatible Interface

1 Features

- Four Operational Modes
 - Torch and Flash up to $I_{LED} = 1200\text{ mA}$
 - Voltage-Regulated Boost Converter: 4.5 V, 5 V, and 5.25 V
 - Shutdown: 0.3 μA (Typical)
- Total Solution Circuit Area < 25 mm²
- Up to 96% Efficiency
- I²C-Compatible Interface up to 400 kbps
- Integrated LED Turnon Safety Timer
- Zero Latency TX-Masking Input (TPS61050)
- Hardware Voltage Mode Selection Input (TPS61052)
- Integrated ADC for LED V_F Monitoring
- Integrated Low Light Dimming Mode
- LED Disconnect During Shutdown
- Open and Shorted LED Protection
- Overtemperature Protection
- Available in a 12-Pin NanoFree™ (CSP) and 10-Pin QFN Packaging

2 Applications

- Camera White LED Torch/Flash for Cell Phones, Smart-Phones and PDAs
- Audio Amplifier Power Supply

Typical Application Schematic

3 Description

The TPS6105x device is based on a high-frequency synchronous-boost topology with constant current sink to drive single white LEDs. The device uses an inductive fixed-frequency PWM control scheme using small external components, minimizing input ripple current.

The 2-MHz switching frequency allows the use of small and low profile 2.2- μH inductors. To optimize overall efficiency, the device operates with only a 250-mV LED feedback voltage.

The TPS6105x device not only operates as a regulated current source, but also as a standard voltage-boost regulator. This additional operating mode can be useful to supply other high-power devices in the system, such as a hands-free audio power amplifier, or any other component requiring a supply voltage higher than the battery voltage (refer to TPS61052).

For highest flexibility, the LED current or the desired output voltage can be programmed through an I²C compatible interface. To simplify flash synchronization with the camera module, the device offers a trigger pin (FLASH_SYNC) for fast LED turnon time.

When the TPS6105x is not in use, it can be put into shutdown mode through the I²C-compatible interface, reducing the input current to 0.3 μA (typical). During shutdown, the LED pin is high impedance to avoid leakage current through the LED.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS61050	VSON (10)	3.00 mm × 3.00 mm
TPS61052	DSBGA (12)	1.96 mm × 1.46 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Pin Functions

NAME	PIN		I/O	DESCRIPTION
	VSON	DSBGA		
AVIN	5	D3	I	This is the input voltage pin of the device. Connect directly to the input bypass capacitor.
VOUT	9	A2	O	Boost converter output.
LED	6	D2	I	LED return input. This feedback pin regulates the LED current through the internal sense resistor by regulating the voltage across it. The regulation operates with typically 250 mV dropout voltage. Connect to the cathode of the LED.
FLASH_SYNC	10	A1	I	Flash strobe pulse synchronization input.
				FLASH_SYNC = LOW (GND): The device is operating and regulating the LED current to the torch current level (TC).
				FLASH_SYNC = HIGH (VIN): The device is operating and regulating the LED current to the flash current level (FC).
SCL	2	B3	I	Serial interface clock line. This pin must not be left floating and must be terminated.
SDA	1	A3	I/O	Serial interface address/data line. This pin must not be left floating and must be terminated.
GPIO	3	C3	I/O	General purpose input/output (refer to REGISTER2). This pin can either be configured as a logic input or as an open-drain output (TPS61050).
ENVM	3	C3	I	Enable pin for voltage mode boost converter (TPS61052).
SW	8	B1, B2	I/O	Inductor connection. Drain of the internal power MOSFET. Connect to the switched side of the inductor. SW is high impedance during shutdown.
PGND	7	C1, C2	—	Power ground. Connect to AGND underneath IC.
AGND	4	D1	—	Analog ground.
PowerPAD™	—	—	—	Internally connected to PGND.

6 Specifications

6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
	Voltage on AVIN, VOUT, SW, LED ⁽²⁾	-0.3	7	V
	Voltage on SCL, SDA, FLASH_SYNC, GPIO, ENVM ⁽²⁾	-0.3	7	V
	Input current on GPIO		25	mA
T _A	Operating ambient temperature ⁽³⁾	-40	85	°C
T _{J (MAX)}	Maximum operating junction temperature		150	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.
- (3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T_{A(max)}) is dependent on the maximum operating junction temperature (T_{J(max)}), the maximum power dissipation of the device in the application (P_{D(max)}), and the junction-to-ambient thermal resistance of the part/package in the application (θ_{JA}), as given by the following equation: $T_{A(max)} = T_{J(max)} - (\theta_{JA} \times P_{D(max)})$.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000
		Machine model (MM)	±200

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage range	2.5	3.6	6	V
V _{OUT}	Output voltage range in Current regulator mode	V _{IN}		5.5	V
	Output voltage range in Voltage regulator mode	4.5		5.25	
L	Inductance effective value range	1.3	2.2	2.9	V
C _{IN}	Input capacitance range		10		µH
C _{OUT}	Output capacitance effective value range	3	10	50	µF
T _J	Operating junction temperature	-40		125	

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS6105x		UNIT
		DRC (VSON)	YZG (DSBGA)	
		10 PINS	12 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	48.5	82	°C/W

7 Detailed Description

7.1 Overview

The TPS6105x family employs a 2-MHz constant-frequency, current-mode PWM converter to generate the output voltage required to drive high-power LEDs. The device integrates a power stage based on an NMOS switch and a synchronous NMOS rectifier. The device also implements a linear low-side current regulator to control the LED current when the battery voltage is higher than the diode forward voltage.

In boost mode, the duty cycle of the converter is set by the error amplifier and the saw-tooth ramp applied to the comparator. Because the control architecture is based on a current-mode control, a compensation ramp is added to allow stable operation at duty cycles larger than 50%. The converter is a fully-integrated synchronous-boost converter, always operating in continuous-conduction mode. This allows low-noise operation, and avoids ringing on the switch pin, which would be seen on a converter when entering discontinuous-conduction mode.

The TPS6105x device not only operates as a regulated current source but also as a standard voltage-boost regulator. In the TPS61052 device, the voltage-mode operation can be activated either by a software command or by means of a hardware signal (ENVM). This additional operating mode can be useful to properly synchronize the converter when supplying other high-power devices in the system, such as a hands-free audio power amplifier, or any other component requiring a supply voltage higher than the battery voltage.

The TPS6105x integrates an I²C-compatible interface, allowing transfers up to 400 kbps. This communication interface can be used to

- set the operating mode (shutdown, constant output current mode vs. constant output voltage mode).
- control the brightness of the external LED (torch and flash modes).
- adjust the output voltage (4.5 V / 5 V / 5.25 V) or to program the safety timer.

For more details, refer to the I²C [Register Description](#) section.

The torch and flash functions can be controlled by the I²C interface. To simplify flash synchronization with the camera module, the device offers a FLASH_SYNC strobe input pin to switch (with zero latency) the LED current from flash to torch light. The maximum duration of the flash pulse can be limited by means of an internal user-programmable safety timer (STIM).

7.2 Functional Block Diagram

Figure 15. Functional Block Diagram

Functional Block Diagram (continued)

Figure 16. Timer Block Diagram (TPS61050)

Functional Block Diagram (continued)

Figure 17. Timer Block Diagram (TPS61052)

7.3 Feature Description

7.3.1 Efficiency

The sense voltage has a direct effect on the converter's efficiency. Because the voltage across the low-side current regulator does not contribute to the output power (LED brightness), the lower the sense voltage, the higher the efficiency will be.

When running in boost mode ($V_{F(LED)} > V_{IN}$), the voltage present at the LED pin of the low-side current regulator is typically 250 mV, which contributes to high power-conversion efficiency.

When running in the linear down-converter mode ($V_{F(LED)} < V_{IN}$), the low-side current regulator drops the voltage difference between the input voltage and the LED forward voltage. Depending on the input voltage and the LED forward voltage characteristic, the converter displays efficiency of approximately 80% to 90%.

7.3.2 Soft-Start

Because the output capacitor always remains biased to the input voltage, the TPS6105x can immediately start switching once it has been enabled through the I²C-compatible interface (refer to MODE_CTRL[1:0] bits). The device starts-up by smoothly ramping up its internal reference voltage, thus limiting the inrush current.

7.3.3 Shutdown

The MODE_CTRL[1:0] bits are low, the device is forced into shutdown. Depending on the setting of OV[1:0] the device can enter different shutdown modes. In shutdown mode, the regulator stops switching and the LED pin is high impedance thus eliminating any DC conduction path.

Feature Description (continued)

If $OV[1:0] \neq 11$, the internal switch and rectifier MOSFET are turned off. VOUT is one body-diode drop below the input voltage and the device consumes only a shutdown current of 0.3 μA (typical). The output capacitor remains biased to the input voltage.

If $OV[1:0] = 11$, the internal switch MOSFET is turned off and the rectifier MOSFET is turned on. In this shutdown mode there is almost no dropout voltage between the converter's input and output. The shutdown current is 150 μA (typical).

7.3.4 LED Failure Modes

If the LED fails as a short circuit, the low-side current regulator limits the maximum output current and the LED FAILURE (LF) flag will be set.

If the LED fails as an open circuit, the control loop initially attempts to regulate off of its low-side current regulator feedback signal. This drives VOUT higher. Because the open-circuited LED will never accept its programmed current, VOUT must be voltage-limited by means of a secondary control loop. In this failure mode, the TPS6105x limits VOUT to 6 V (typical) and sets the LED FAILURE (LF) flag.

7.3.5 Undervoltage Lockout

The undervoltage lockout circuit prevents the device from misoperation at low input voltages. It prevents the converter from turning on the switch or rectifier MOSFET under undefined conditions.

7.3.6 Thermal Shutdown

As soon as the junction temperature, T_J , exceeds 160°C typical, the device goes into thermal shutdown. In this mode, the *boost* power stage and the low-side current regulator are turned off, the MODE_CTRL[1:0] bits are reset, the OVERTEMP bit is set and can only be reset by a readout.

7.4 Device Functional Modes

7.4.1 Operating Modes: Torch and Flash

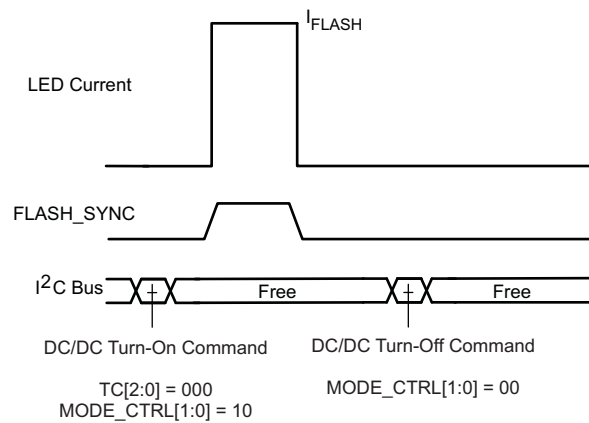

The device operation is more easily understood by referring to the timer block diagram. Depending on the settings of MODE_CTRL[1:0] bits the device can enter 4 different operating modes:

- MODE_CTRL[1:0] = 00: The device is in shutdown mode.
- MODE_CTRL[1:0] = 01: The device is regulating the LED current to the torch current level (TC bits) regardless of the FLASH_SYNC input and START_FLASH/TIMER (SFT) bit. The safety timer is disabled in this operating mode.
- MODE_CTRL[1:0] = 11: The device is regulating a constant output voltage according to OV[1:0] bits settings. The low-side LED current regulator is disabled and the LED is disconnected from the output. In this operating mode, the safety timer is disabled and the general purpose timer (DCTIM) can be used to generate a software time-out (TO) flag. DCTIM start is triggered on the rising edge of START_FLASH/TIMER (SFT).
- MODE_CTRL[1:0] = 10: The flash pulse can be either trigger by a hardware signal (FLASH_SYNC) or by a software bit (SFT).

Flash strobe is level sensitive (STT = 0): LED strobe pulse follows FLASH_SYNC

- FLASH_SYNC and (SFT) = 0: LED operation is set to the torch current level and the safety timer is disabled.
- FLASH_SYNC or (SFT) = 1: The LED is driven at the flash current level and the safety timer is running.

The maximum duration of the flash pulse is defined in the STIM register.

Device Functional Modes (continued)

Figure 18. Torch Mode Operation

Figure 19. Synchronized Flash Strobe

Figure 20. Level Sensitive Safety Timer (Time-Out)

Device Functional Modes (continued)

Figure 21. Level Sensitive Safety Timer (Normal Operation + Time-Out)

The safety timer is started by:

- a rising edge of FLASH_SYNC signal.
- a rising edge of START_FLASH/TIMER (SFT) bit.

The safety timer is stopped by:

- a low level of FLASH_SYNC signal or START_FLASH/TIMER (SFT) bit.
- a time-out signal (TO).

The START-FLASH/TIMER (SFT) bit is reset by the time-out (TO) signal.

The Flash strobe is edge sensitive (STT = 1): The LED strobe pulse is triggered by a rising edge

When FLASH_SYNC and START_FLASH/TIMER (SFT) are both low, the LED operation is set to the torch current level without time-out.

The duration of the flash pulse is defined in the STIM register. The flash strobe is started by:

- a rising edge of FLASH_SYNC signal.
- a rising edge of START_FLASH/TIMER (SFT) bit.

Once running, the timer ignores any triggering signal, and only stops after a time-out (TO). The START-FLASH/TIMER (SFT) bit is reset by the time-out (TO) signal.

Figure 22. Edge Sensitive Timer (Single Trigger Event)

Figure 23. Edge Sensitive Timer (Single Trigger Event)

Device Functional Modes (continued)

Figure 24. Edge Sensitive Timer (Multiple Trigger Events)

7.4.2 Mode of Operation: Flash Blanking (TPS61050)

The TPS61050 device also integrates a general purpose I/O pin (GPIO) that can be configured either as a standard logic input/output or as a flash masking input (Tx-MASK). This blanking function turns the LED from flash to torch light, thereby reducing almost instantaneously the peak current loading from the battery. The Tx-MASK function has no influence on the safety timer duration.

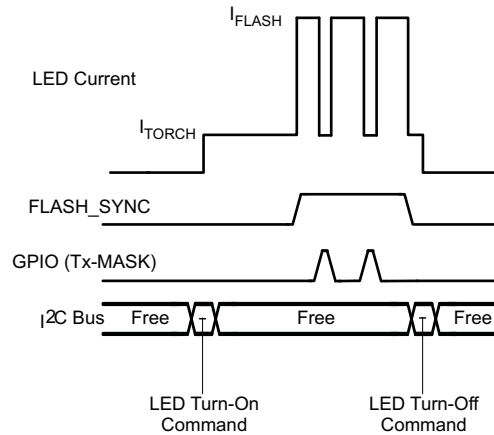

Figure 25. Synchronized Flash With Blanking Periods

7.4.3 Hardware Voltage Mode Selection (TPS61052)

The TPS61052 device integrates a logic input (ENVM) that can be used to force the converter to run in voltage mode regulation. This additional operating mode can be useful to supply other high power consumption devices in the system (for example, hands-free audio power amplifier) or any other component requiring a supply voltage higher than the battery voltage.

Table 2 gives an overview of the different mode of operation of TPS61052.

Table 2. TPS61052 Operating Modes

INTERNAL REGISTER SETTINGS MODE_CTRL[1:0]	ENVM	OPERATING MODES
00	0	Power stage is in shutdown. The output is either connected directly to the battery (OV[1:0]=11, rectifier is bypassed) or through the rectifier's body diode (OV[1:0]=01). In both case the power stage LC filter is connected in series between the battery and the output.
01	0	LED is turned-on for DC light operation. The converter is operating in the current regulation mode (CM). The output voltage is controlled by the forward voltage characteristic of the LED.
10	0	LED is turned-on for flash operation. The converter is operating in the current regulation mode (CM). The output voltage is controlled by the forward voltage characteristic of the LED.
11	0	LED is turned-off and the converter is operating in the voltage regulation mode (VM). The output voltage is set through the register OV[1:0].
00	1	LED is turned-off and the converter is operating in the voltage regulation mode (VM). The output voltage is set through the register OV[1:0].

Device Functional Modes (continued)

Table 2. TPS61052 Operating Modes (continued)

INTERNAL REGISTER SETTINGS MODE_CTRL[1:0]	ENVM	OPERATING MODES
01	1	The converter is operating in the voltage regulation mode (VM) and it's output voltage is set through the register OV[1:0]. The LED is turned-on for torch operation according to the register TC[2:0]. The LED current is regulated by the means of the low-side current sink.
10	1	The converter is operating in the voltage regulation mode (VM) and it's output voltage is set through the register OV[1:0]. The LED is turned-on for flash operation according to the register FC[2:0]. The LED current is regulated by the means of the low-side current sink.
11	1	LED is turned-off and the converter is operating in the voltage regulation mode (VM). The output voltage is set through the register OV[1:0].

7.4.4 Low Light Dimming Mode

The TPS6105x device features white LED drive capability at very low light intensity. To generate a reduced LED average current, the device employs a 122-Hz fixed frequency PWM modulation scheme. Operation is understood best by referring to the timer block diagram.

The torch current is modulated with a duty cycle defined by the DCTIM[2:0] bits. The low light dimming mode can only be activated in the torch only mode, MODE_CTRL[1:0] = 01.

Figure 26. PWM Dimming Principle

White LED blinking can be achieved by turning on/off periodically the LED dimmer through the (DIM) bit, see Figure 27.

Figure 27. White LED Blinking Control

7.5 Programming

7.5.1 3-Bit ADC

The TPS6105x device integrates a 3 bit A/D converter to measure the differential voltage across the output and the low-side current regulator. To get a proper settling of the LED forward voltage, the data acquisition is done approximately 10 ms after the start of the flash sequence.

When running in the linear down-mode ($V_{F(LED)} < V_{IN}$), the low-side current regulator drops the voltage difference between the input voltage and the LED forward voltage. This may result in thermal limitations (especially for CSP-12 packaging) when running high LED current under high battery conditions ($V_{IN} \geq 4.5$ V) with low forward voltage LEDs and/or high ambient temperature.

The LED forward voltage measurement can be started either by a START FLASH event (FLASH_SYNC or SFT bit) or by setting ADC[2:0] bits (whilst MODE_CTRL[1:0]=01 or 10).

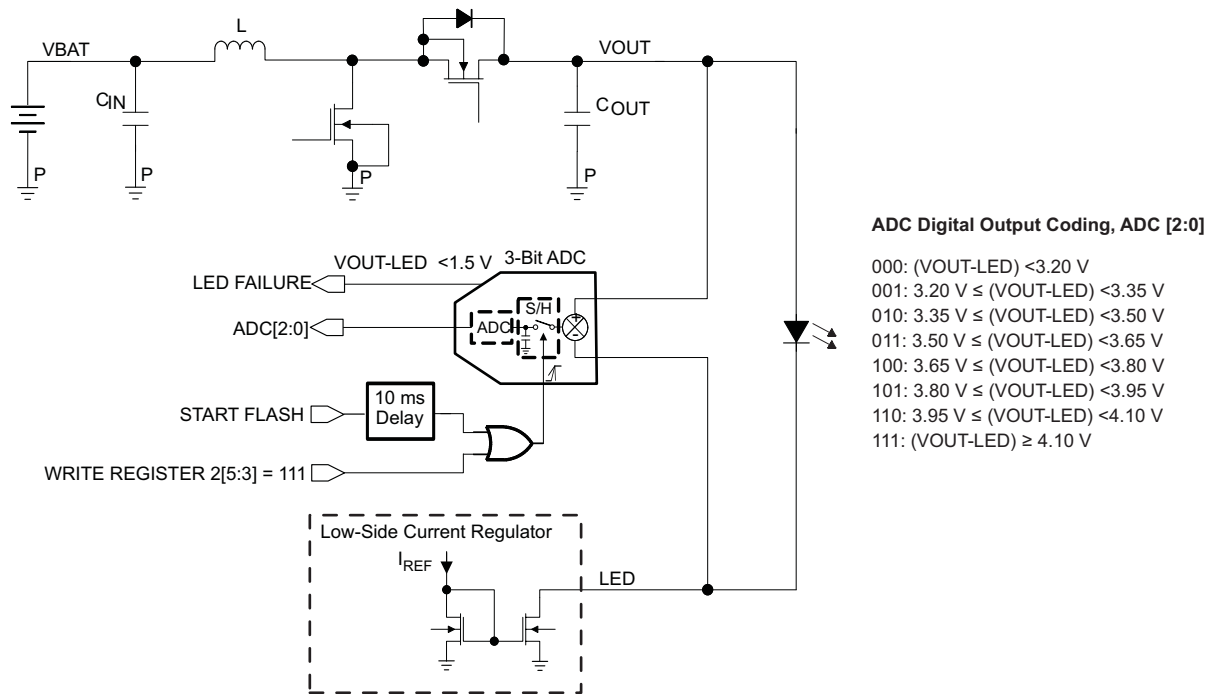

Figure 28. LED VF Measurement Principle

7.5.2 Serial Interface Description

I²C is a 2-wire serial interface developed by Philips Semiconductor (see I²C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is *idle*, both SDA and SCL lines are pulled high. All the I²C compatible devices connect to the I²C bus through open-drain I/O pins, SDA and SCL. A *master* device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A *slave* device receives and/or transmits data on the bus under control of the master device.

The TPS6105x device works as a *slave* and supports the following data transfer *modes*, as defined in the I²C-Bus Specification: standard mode (100 kbps) and fast mode (400 kbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents remain intact as long as the supply voltage remains greater than approximately 2 V.

The data transfer protocol for standard and fast modes is exactly the same, therefore they are referred to as F/S-mode in this document. The TPS6105x device supports 7-bit addressing; 10-bit addressing and general call address are not supported. The device 7-bit address is defined as 011 0011.

Programming (continued)

7.5.3 F/S-Mode Protocol

The master initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in Figure 29. All I²C-compatible devices should recognize a start condition.

Figure 29. Start and Stop Conditions

The master then generates the SCL pulses, and transmits the 7-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the master ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see Figure 30). All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an acknowledge (see Figure 31) by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the master knows that communication link with a slave has been established.

Figure 30. Bit Transfer on the Serial Interface

The master generates further SCL cycles to either transmit data to the slave (R/W bit 1) or receive data from the slave (R/W bit 0). In either case, the receiver must acknowledge the data sent by the transmitter. So an acknowledge signal can either be generated by the master or by the slave, depending on which one is the receiver. 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary.

To signal the end of the data transfer, the master generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see Figure 29). This releases the bus and stops the communication link with the addressed slave. All I²C compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released, and they wait for a start condition followed by a matching address.

Attempting to read data from register addresses not listed in this section will result in 00h being read out.

Programming (continued)

Figure 31. Acknowledge on the I²C Bus

Figure 32. Bus Protocol

7.5.4 TPS6105X I²C Update Sequence

The TPS6105x requires a start condition, a valid I²C address, a register address byte, and a data byte for a single update. After the receipt of each byte, TPS6105x device acknowledges by pulling the SDA line low during the high period of a single clock pulse. A valid I²C address selects the TPS6105x. TPS6105x performs an update on the rising edge of the SCL clock that follows the ACK bit transmission.

Programming (continued)

Figure 33. Write Data Transfer Format In F/S-Mode

Figure 34. Read Data Transfer Format In F/S-Mode

SLAVE ADDRESS BYTE

MSB							LSB
X	0	1	1	0	0	1	1

The slave address byte is the first byte received following the START condition from the master device.

REGISTER ADDRESS BYTE

MSB							LSB
0	0	0	0	0	0	D1	D0

Following the successful acknowledgement of the slave address, the bus master will send a byte to the TPS6105x, which will contain the address of the register to be accessed. The TPS6105x contains four 8-bit registers accessible through a bidirectional I²C-bus interface. All internal registers have read and write access.

7.6 Register Maps

7.6.1 Register Description

- (1) 400 mA/500 mA current level can only be activated when DIR = 0, Tx-MASK = 1 and GPIO input is set high. This operating mode only applies to TPS61050.
- (2) MODE_CTRL[1:0] = 00, VOUT is one body diode below the input voltage, I_Q = 0.3 μA (typical).
- (3) MODE_CTRL[1:0] = 00, rectifier MOSFET is turned on shorting VOUT and SW, I_Q = 150 μA (typical).

Figure 35. Register0 (Read/Write) (TPS6105X)

Register Maps (continued)

Figure 36. Register1 (Read/Write) (TPS6105X)

Register Maps (continued)

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Inductor Selection

A boost converter requires two main passive components for storing energy during the conversion. A boost inductor and a storage capacitor at the output are required. The TPS6105x device integrates a current limit protection circuitry. The peak current of the NMOS switch is sensed to limit the maximum current flowing through the switch and the inductor. The typical peak current limit (1000 mA / 1500 mA / 2000 mA) is user selectable through the I²C interface.

To optimize solution size the TPS6105x device has been designed to operate with inductance values from a minimum of 1.3 μH to a maximum of 2.9 μH. In typical high-current white LED applications, TI recommends an inductance of 2.2 μH.

To select the boost inductor, TI recommends keeping the possible peak inductor current below the current limit threshold of the power switch in the chosen configuration. The highest peak current through the inductor and the power switch depends on the output load, the input and output voltages. Estimation of the maximum average inductor current and the maximum inductor peak current can be done using [Equation 1](#) and [Equation 2](#):

$$I_L \approx I_{OUT} = \frac{V_{OUT}}{\eta \times V_{IN}} \quad (1)$$

$$I_L (\text{PEAK}) = \frac{V_{IN} \times D}{2 \times f \times L} + \frac{I_{OUT}}{(1-D) \times \eta} \text{ with } D = \frac{V_{OUT} - V_{IN}}{V_{OUT}} \quad (2)$$

with:

f = switching frequency (2 MHz)

L = inductance value (2.2 μH)

η = estimated efficiency (85%)

For example, for an output current of 500 mA at 5 V, the TPS6105x device must be set for a 1000 mA current limit operation together with an inductor supporting this peak current.

The losses in the inductor caused by magnetic hysteresis losses and copper losses are a major parameter for total circuit efficiency.

Table 4. List of Inductors

MANUFACTURER	SERIES	DIMENSIONS	ILIM SETTINGS
TDK	VLF3010AT	2.6 mm × 2.8 mm × 1 mm maximum height	1000 mA (typical)
TAIYO YUDEN	NR3010	3 mm × 3 mm × 1 mm maximum height	
TDK	VLF3014AT	2.6 mm × 2.8 mm × 1.4 mm maximum height	1500 mA (typical)
COILCRAFT	LPS3015	3 mm × 3 mm × 1.5 mm maximum height	
MURATA	LQH3NP	3 mm × 3 mm × 1.5 mm maximum height	2000 mA (typical)
TOKO	FDSE0312	3 mm × 3 mm × 1.2 mm maximum height	

8.2.1.2.2 Capacitor Selection

8.2.1.2.2.1 Input Capacitor

For good input voltage filtering low ESR ceramic capacitors are recommended. A 10-μF input capacitor is recommended to improve transient behavior of the regulator and EMI behavior of the total power supply circuit. The input capacitor should be placed as close as possible to the input pin of the converter.

8.2.1.2.2.2 Output Capacitor

The primary parameter necessary to define the output capacitor is the maximum allowed output voltage ripple of the converter. This ripple is determined by two parameters of the capacitor, the capacitance and the ESR. It is possible to calculate the minimum capacitance needed for the defined ripple, supposing that the ESR is zero, by using [Equation 3](#):

$$C_{min} \approx \frac{I_{OUT} \times (V_{OUT} - V_{IN})}{f \times \Delta V \times V_{OUT}} \quad (3)$$

Parameter f is the switching frequency and ΔV is the maximum allowed ripple.

With a chosen ripple voltage of 10mV, a minimum capacitance of 10 μF is needed. The total ripple is larger due to the ESR of the output capacitor. This additional component of the ripple can be calculated using Equation 4:

$$\Delta V_{\text{ESR}} = I_{\text{OUT}} \times R_{\text{ESR}} \quad (4)$$

The total ripple is the sum of the ripple caused by the capacitance and the ripple caused by the ESR of the capacitor. Additional ripple is caused by load transients. This means that the output capacitor must completely supply the load during the charging phase of the inductor. A reasonable value of the output capacitance depends on the speed of the load transients and the load current during the load change.

For the high current white LED application, a minimum of 3- μF effective output capacitance is usually required when operating with 2.2- μH (typical) inductors. For solution size reasons, this is usually one or more X5R/X7R ceramic capacitors. For stable operation of the internally compensated control loop, a maximum of 50 μF effective output capacitance is tolerable.

Depending on the material, size and margin to the rated voltage of the used output capacitor, degradation on the effective capacitance can be observed. This loss of capacitance is related to the DC bias voltage applied. It is therefore always recommended to check that the selected capacitors are showing enough effective capacitance under real operating conditions.

8.2.1.2.3 Checking Loop Stability

The first step of circuit and stability evaluation is to look from a steady-state perspective at the following signals:

- Switching node, SW
- Inductor current, I_L
- Output ripple voltage, $V_{\text{OUT(AC)}}$

These are the basic signals that must be measured when evaluating a switching converter. When the switching waveform shows large duty cycle jitter or the output voltage or inductor current shows oscillations the regulation loop may be unstable. This is often a result of board layout and/or L-C combination.

The next step in regulation loop evaluation is to perform a load transient test. Output voltage settling time after the load transient event is a good estimate of the control loop bandwidth. The amount of overshoot and subsequent oscillations (ringing) indicates the stability of the control loop. Without any ringing, the loop has usually more than 45° of phase margin.

Because the damping factor of the circuitry is directly related to several resistive parameters (for example, MOSFET $r_{\text{DS(on)}}$) that are temperature dependant, the loop stability analysis must be done over the input voltage range, output current range, and temperature range.

Figure 61 shows the typical application where TPS61050 is used to drive dual LED camera flash (2 × 300 mA).

Figure 61. 2 × 300 mA Dual LED Camera Flash

9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range from 2.5 V to 6 V. This input supply must be well regulated. If the input supply is located more than a few inches from the converter, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. A typical choice is an electrolytic or tantalum capacitor with a value of 47 μ F.

10 Layout

10.1 Layout Guidelines

As for all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator could show stability problems as well as EMI problems. Therefore, use wide and short traces for the main current path and for the power ground tracks.

The input capacitor, output capacitor, and the inductor should be placed as close as possible to the IC. Use a common ground node for power ground and a different one for control ground to minimize the effects of ground noise. Connect these ground nodes at any place close to one of the ground pins of the IC.

To lay out the control ground, TI recommends using short traces as well, separated from the power ground traces. This avoids ground shift problems, which can occur due to superimposition of power ground current and control ground current.

10.2 Layout Example

Figure 62. Typical PC-Board Layout

10.3 Thermal Considerations

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependant issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power-dissipation limits of a given component.

Use the following three basic approaches for enhancing thermal performance:

- Improving the power dissipation capability of the PCB design
- Improving the thermal coupling of the component to the PCB
- Introducing airflow in the system

Junction-to-ambient thermal resistance is highly application and board-layout dependent. In applications where high maximum power dissipation exists, special care must be paid to thermal dissipation issues in board design. The maximum junction temperature (T_J) of the TPS6105x is 150°C.

Thermal Considerations (continued)

The maximum power dissipation gets especially critical when the device operates in the linear down mode at high LED current. For single pulse power thermal analysis (for example, flash strobe), the allowable power dissipation for the device is given by [Figure 63](#).

Figure 63. Single Pulse Power Capability (CSP Package)

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

4204102-3/L 09/11

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - Small Outline No-Lead (SON) package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance, if present.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions, if present

THERMAL PAD MECHANICAL DATA

DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

LAND PATTERN DATA

DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
