

Four 1-Bit, 10MHz, 2nd-Order Delta-Sigma Modulators

FEATURES

- 16-Bit Resolution
- 14-Bit Linearity
- Resolution/Speed Trade-Off: 10-Bit Effective Resolution with 10 μ s Signal Delay (12-Bit with 19 μ s)
- ± 2.5 V Input Range at 2.5V
- Internal Reference Voltage: 2%
- Gain Error: 0.5%
- Four Independent Delta-Sigma Modulators
- Four Input Reference Buffers
- Onboard 20MHz Oscillator
- Selectable Internal or External Clock
- Operating Temperature Range: -40°C to $+105^{\circ}\text{C}$
- QFN-32 (5x5) Package

APPLICATIONS

- Motor Control
- Current Measurement
- Industrial Process Control
- Instrumentation
- Smart Transmitters
- Portable Instruments
- Weight Scales
- Pressure Transducers

DESCRIPTION

The ADS1204 is a four-channel, high-performance device, with four delta-sigma ($\Delta\Sigma$) modulators with 100dB dynamic range, operating from a single +5V supply. The differential inputs are ideal for direct connection to transducers in an industrial environment. With the appropriate digital filter and modulator rate, the device can be used to achieve 16-bit analog-to-digital (A/D) conversion with no missing code. Effective resolution of 12 bits can be obtained with a digital filter data rate of 160kHz at a modulator rate of 10MHz. The ADS1204 is designed for use in medium- to high-resolution measurement applications including current measurements, smart transmitters, industrial process control, weight scales, chromatography, and portable instrumentation. It is available in a QFN-32 (5x5) package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION⁽¹⁾

PRODUCT	MAXIMUM INTEGRAL LINEARITY ERROR (LSB)	MAXIMUM GAIN ERROR (%)	PACKAGE-LEAD	PACKAGE DESIGNATOR	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
ADS1204	±3	±0.5	QFN-32	RHB	-40°C to +105°C	ADS1204I	ADS1204IRHBT	Tape and Reel, 250
							ADS1204IRHBR	Tape and Reel, 3000

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Over operating free-air temperature range, unless otherwise noted.

	ADS1204	UNIT
Supply voltage, AV _{DD} to AGND	-0.3 to 6	V
Supply voltage, BV _{DD} to BGND	-0.3 to 6	V

GENERAL DESCRIPTION

The ADS1204 is a four-channel, second-order, CMOS device with four delta-sigma ($\Delta\Sigma$) modulators, designed for medium- to high-resolution A/D signal conversions from dc to 39kHz (filter response -3dB) if an oversampling ratio (OSR) of 64 is chosen. The output of the converter (OUTX) provides a stream of digital ones and zeros. The time average of this serial output is proportional to the analog input voltage.

The modulator shifts the quantization noise to high frequencies. A low-pass digital filter should be used at the output of the $\Delta\Sigma$ modulator. The filter serves two functions. First, it filters out high-frequency noise. Second, the filter converts the 1-bit data stream at a high sampling rate into a higher-bit data word at a lower rate (decimation).

An application-specific integrated circuit (ASIC) or field-programmable gate array (FPGA) could be used to implement the digital filter. Figure 26 and Figure 27 show typical application circuits with the ADS1204 connected to an FPGA.

The overall performance (that is, speed and accuracy) depends on the selection of an appropriate OSR and filter type. A higher OSR produces greater output accuracy while operating at a lower refresh rate. Alternatively, a lower OSR produces lower output accuracy, but operates at a higher refresh rate. This system allows flexibility with the digital filter design and is capable of A/D conversion results that have a dynamic range exceeding 100dB with an OSR equal to 256.

Figure 26. Single-Ended Connection Diagram for the ADS1204 $\Delta\Sigma$ Modulator

Figure 27. Differential Connection Diagram for the ADS1204 ΔΣ Modulator

THEORY OF OPERATION

The differential analog input of the ADS1204 is implemented with a switched-capacitor circuit. This circuit implements a second-order modulator stage, which digitizes the analog input signal into a 1-bit output stream. The clock source can be internal as well as external. Different frequencies for this clock allow for a variety of solutions and signal bandwidths. Every analog input signal is continuously sampled by the modulator and compared to a reference voltage that is applied to the REFINx pin. A digital stream, which accurately represents the analog input voltage over time, appears at the output of the corresponding converter.

ANALOG INPUT STAGE

Analog Input

The topology of the analog inputs of ADS1204 is based on fully differential switched-capacitor architecture. This input stage provides the mechanism to achieve low system noise, high common-mode rejection (100dB), and excellent power-supply rejection.

The input impedance of the analog input is dependent on the modulator clock frequency (f_{CLK}),

which is also the sampling frequency of the modulator. Figure 28 shows the basic input structure of one channel of the ADS1204. The relationship between the input impedance of the ADS1204 and the modulator clock frequency is shown in Equation 1:

$$Z_{IN} = \frac{100k\Omega}{f_{MOD}/10MHz} \quad (1)$$

The input impedance becomes a consideration in designs where the source impedance of the input signal is high. This high impedance may cause degradation in gain, linearity, and THD. The importance of this effect depends on the desired system performance. There are two restrictions on the analog input signals, CH x+ and CH x-. If the input voltage exceeds the range ($GND - 0.3V$) to ($V_{DD} + 0.3V$), the input current must be limited to 10mA because the input protection diodes on the front end of the converter will begin to turn on. In addition, the linearity and the noise performance of the device are ensured only when the differential analog voltage resides within $\pm 2V$ (with V_{REF} as a midpoint); however, the FSR input voltage is $\pm 2.5V$.

Figure 28. Input Impedance of the ADS1204

Modulator

The ADS1204 can be operated in two modes. When CKLSEL = 1, the four modulators operate using the internal clock, which is fixed at 20MHz. When CKLSEL = 0, the modulators operate using an external clock. In both modes, the clock is divided by two internally and functions as the modulator clock. The frequency of the external clock can vary from 1MHz to 32MHz to adjust for the clock requirements of the application.

The modulator topology is fundamentally a second-order, switched-capacitor, $\Delta\Sigma$ modulator, such as the one conceptualized in Figure 29. The analog input voltage and the output of the 1-bit digital-to-analog converter (DAC) are differentiated, providing analog voltages at X2 and X3. The voltages at X2 and X3 are presented to their individual integrators. The output of these integrators progresses in a negative or positive direction. When the value of the signal at X4 equals the comparator reference voltage, the output of the comparator switches from negative to positive, or positive to negative, depending on its original state. When the output value of the comparator switches from high to low or vice versa, the 1-bit DAC responds on the next

clock pulse by changing its analog output voltage at X6, causing the integrators to progress in the opposite direction. The feedback of the modulator to the front end of the integrators forces the value of the integrator output to track the average of the input.

DIGITAL OUTPUT

A differential input signal of 0V will ideally produce a stream of ones and zeros that are high 50% of the time and low 50% of the time. A differential input of +2V produces a stream of ones and zeros that are high 80% of the time. A differential input of -2V produces a stream of ones and zeros that are high 20% of the time. The input voltage versus the output modulator signal is shown in Figure 30.

Figure 29. Block Diagram of the Second-Order Modulator

Figure 30. Analog Input vs Modulator Output of the ADS1204

DIGITAL INTERFACE

INTRODUCTION

The analog signal connected to the input of the $\Delta\Sigma$ modulator is converted using the clock signal applied to the modulator. The result of the conversion, or modulation, is generated and sent to the OUTx pin from the $\Delta\Sigma$ modulator. In most applications where a direct connection is realized between the $\Delta\Sigma$ modulator and an ASIC or FPGA (each with an implemented filter), the two standard signals per modulator (CLKOUT and OUTx) are provided from the modulator. The output clock signal is equal for all four modulators. If CLKSEL = 1, CLKIN must always be set either high or low.

MODES OF OPERATION

The system clock of the ADS1204 is 20MHz by default. The system clock can be provided either from the internal 20MHz RC oscillator or from an external clock source. For this purpose, the CLKIN pin is provided; it is controlled by the mode setting, CLKSEL.

The system clock is divided by two for the modulator clock. Therefore, the default clock frequency of the modulator is 10MHz. With a possible external clock range of 1MHz to 32MHz, the modulator operates between 500kHz and 16MHz.

FILTER USAGE

The modulator generates only a bitstream, which does not output a digital word like an A/D converter. In order to output a digital word equivalent to the analog input voltage, the bitstream must be processed by a digital filter.

A very simple filter, built with minimal effort and hardware, is the Sinc³ filter shown in Equation 2:

$$H(z) = \left(\frac{1 - z^{-OSR}}{1 - z^{-1}} \right)^2 \quad (2)$$

This filter provides the best output performance at the lowest hardware size (for example, a count of digital gates). For oversampling ratios in the range of 16 to 256, this is a good choice. All the characterizations in the data sheet are also done using a Sinc³ filter with an oversampling ratio of OSR = 256 and an output word width of 16 bits.

In a Sinc³ filter response (shown in Figure 31 and Figure 32), the location of the first notch occurs at the

frequency of output data rate $f_{DATA} = f_{CLK}/OSR$. The -3dB point is located at half the Nyquist frequency or $f_{DATA}/4$. For some applications, it may be necessary to use another filter type for better frequency response.

This performance can be improved, for example, by a cascaded filter structure. The first decimation stage can be a Sinc³ filter with a low OSR and the second stage a high-order filter.

For more information, see application note SBAA094, *Combining the ADS1202 with an FPGA Digital Filter for Current Measurement in Motor Control Applications*, available for download at www.ti.com.

Figure 31. Frequency Response of Sinc³ Filter

Figure 32. Pulse Response of Sinc³ Filter ($f_{MOD} = 10\text{MHz}$)

The effective number of bits (ENOB) can be used to compare the performance of A/D converters and $\Delta\Sigma$ modulators. Figure 33 shows the ENOB of the ADS1204 with different filter types. In this data sheet, the ENOB is calculated from the SNR as shown in Equation 3:

$$\text{SNR} = 1.76\text{dB} + 6.02\text{dB} \times \text{ENOB} \tag{3}$$

Figure 33. Measured ENOB vs OSR

In motor control applications, a very fast response time for overcurrent detection is required. There is a constraint between $1\mu\text{s}$ and $5\mu\text{s}$ with 3 bits to 7 bits resolution. The time for full settling is dependent on the filter order. Therefore, the full settling of the Sinc^3 filter needs three data clocks and the Sinc^2 filter needs two data clocks. The data clock is equal to the modulator clock divided by the OSR. For overcurrent

protection, filter types other than Sinc^3 might be a better choice. A simple example is a Sinc^2 filter. Figure 34 compares the settling time of different filter types. The Sincfast is a modified Sinc^2 filter as Equation 4 shows:

$$H(z) = \left(\frac{1 - z^{-\text{OSR}}}{1 - z^{-1}} \right)^2 (1 + z^{-2 \times \text{OSR}}) \tag{4}$$

Figure 34. Measured ENOB vs Settling Time

For more information, see application note SBAA094, *Combining the ADS1202 with an FPGA Digital Filter for Current Measurement in Motor Control Applications*, available for download at www.ti.com.

LAYOUT CONSIDERATIONS

POWER SUPPLIES

An applied external digital filter rejects high-frequency noise. PSRR and CMRR improve at higher frequencies because the digital filter suppresses high-frequency noise.

However, the suppression of the filter is not infinite, so high-frequency noise still influences the conversion result. Inputs to the ADS1204, such as CH x+, CH x-, and CLKIN, should not be present before the power supply is on. Violating this condition could cause latch-up. If these signals are present before the supply is on, series resistors should be used to limit the input current to a maximum of 10mA. Experimentation may be the best way to determine the appropriate connection between the ADS1204 and different power supplies.

GROUNDING

Analog and digital sections of the design must be carefully and cleanly partitioned. Each section should have its own ground plane with no overlap between them. Do not join the ground planes; instead, connect the two with a moderate signal trace underneath the converter. However, for different applications with DSPs and switching power supplies, this process might be different.

For multiple converters, connect the two ground planes as close as possible to one central location for all of the converters. In some cases, experimentation may be required to find the best point to connect the two planes together.

DECOUPLING

Good decoupling practices must be used for the ADS1204 and for all components in the design. All decoupling capacitors, specifically the 0.1 μ F ceramic capacitors, must be placed as close as possible to the pin being decoupled. A 1 μ F and 10 μ F capacitor, in parallel with the 0.1 μ F ceramic capacitor, can be used to decouple AV_{DD} to AGND as well as BV_{DD} to BGND. At least one 0.1 μ F ceramic capacitor must be used to decouple every AV_{DD} to AGND and BV_{DD} to BGND, as well as for the digital supply on each digital component.

The digital supply sets the I/O voltage for the interface and can be set within a range of 2.7V to 5.5V.

In cases where both the analog and digital I/O supplies share the same supply source, an RC filter of 10 Ω and 0.1 μ F can be used to help reduce the noise in the analog supply.

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (August 2007) to Revision C	Page
• Updated document format	1
• Extended operating temperature range from +85°C to +105°C throughout document	1
• Deleted operating free-air temperature range row from <i>Absolute Maximum Ratings</i> table	2
• Added free-air temperature range ratings to <i>Recommended Operating Conditions</i> table	2
• Changed <i>Dissipation Ratings</i> table.....	3
• Changed typical specification in <i>Input capacitance</i> row of <i>Analog Input</i> section of <i>Electrical Characteristics</i> table.....	3
• Added additional specification for Total Harmonic Distortion in <i>AC Accuracy</i> section of <i>Electrical Characteristics</i> table	3
• Deleted test condition of V_{OUT} row in <i>Voltage Reference Output</i> section of <i>Electrical Characteristics</i> table	3
• Updated typical characteristic graphs to reflect extended temperature range	9

Changes from Revision A (June 2004) to Revision B	Page
• Added note to QFN package	6

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS1204IRHBR	ACTIVE	VQFN	RHB	32	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 105	ADS 1204I	Samples
ADS1204IRHBT	ACTIVE	VQFN	RHB	32	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 105	ADS 1204I	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) Package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

NOTE: A. All linear dimensions are in millimeters

RHB (S-PVQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - E. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for any larger diameter vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
