

# **bq51010B Highly Integrated Wireless Receiver Qi (WPC v1.1) Compliant Power Supply**

## **1 Features**

- Integrated Wireless Power Supply Receiver Solution With a 7-V Regulated Supply
  - 93% Overall Peak AC-DC Efficiency
  - Full Synchronous Rectifier
  - WPC v1.1 Compliant Communication Control
  - Output Voltage Conditioning
  - Only IC Required Between RX Coil and 7-V Output
- WPC v1.1 Compliant (FOD Enabled) Highly Accurate Current Sense
- Dynamic Rectifier Control for Improved Load Transient Response
- Dynamic Efficiency Scaling for Optimized Performance Over Wide Range of Output Power
- Adaptive Communication Limit for Robust Communication
- Supports 20-V Maximum Input
- Low-power Dissipative Rectifier Overvoltage Clamp ( $V_{OVP} = 15\text{ V}$ )
- Thermal Shutdown
- Multifunction NTC and Control Pin for Temperature Monitoring, Charge Complete and Fault Host Control

## **2 Applications**

- WPC v1.1 Compliant Receivers
- Cell Phones and Smart Phones
- Headsets
- Digital Cameras
- Portable Media Players
- Hand-Held Devices

## **3 Description**

The bq51010B is a family of advanced, flexible, secondary-side devices for wireless power transfer in portable applications. The bq51010B devices provide the AC-DC power conversion and regulation while integrating the digital control required to comply with the Qi v1.1 communication protocol. Together with the bq50xxx primary-side controller, the bq51010B enables a complete contact-less power transfer system for a wireless power supply solution. Global feedback is established from the secondary to the primary to control the power transfer process using the Qi v1.1 protocol.

The bq51010B devices integrate a low resistance synchronous rectifier, low-dropout regulator, digital control, and accurate voltage and current loops to ensure high efficiency and low power dissipation.

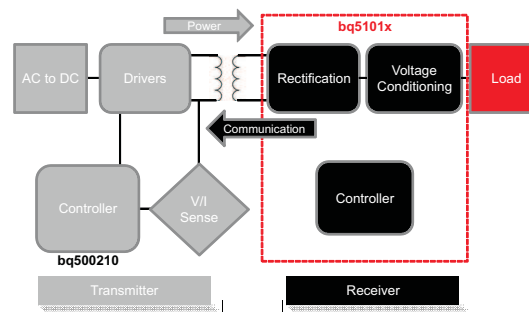

The bq51010B also includes a digital controller that can calculate the amount of power received by the mobile device within the limits set by the WPC v1.1 standard. The controller will then communicate this information to the transmitter to allow the transmitter to determine if a foreign object is present within the magnetic interface and introduces a higher level of safety within magnetic field. This Foreign Object Detection (FOD) method is part of the requirements under the WPC v1.1 specification.

### **Device Information <sup>(1)</sup>**

PART NUMBER	PACKAGE	BODY SIZE (NOM)
bq51010B	DSBGA (28)	1.90 mm x 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

### Changes from Original (December 2012) to Revision A

Page

- Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ..... **1**
- Removed *Package Summary*, see POA at the end of the data sheet ..... **1**

## 5 Device Comparison Tables

DEVICE	FUNCTION	V <sub>OUT</sub> (V <sub>BAT-REG</sub> )	PROTOCOL	MAXIMUM P <sub>OUT</sub>	I <sup>2</sup> C
bq51003	Wireless receiver	5 V	Qi v1.1	2.5 W	No
bq51013B	Wireless receiver	5 V	Qi v1.1	5 W	No
bq51010B	Wireless receiver	7 V	Qi v1.1	5 W	No
bq51020	Wireless receiver	4.5 to 8 V	Qi v1.1	5 W	No
bq51021	Wireless receiver	4.5 to 8 V	Qi v1.1	5 W	Yes
bq51221	Dual mode wireless receiver	4.5 to 8 V	Qi v1.1, PMA	5 W	Yes
bq51025	Wireless receiver	4.5 to 10 V	Qi v1.1 (in 5 W mode)	10 W	Yes
bq51020B	Wireless receiver and direct charger	4.2 V	Qi v1.1	5 W	No
bq51051B	Wireless receiver and direct charger	4.35 V	Qi v1.1	5 W	No
bq51052B	Wireless receiver and direct charger	4.4 V	Qi v1.1	5 W	No

**Table 1. Device Options**

DEVICE	FUNCTION	WPC VERSION	V <sub>RECT-OVP</sub>	V <sub>OUT-(REG)</sub>	OVER CURRENT SHUTDOWN	AD-OVP	TERMINATION	COMMUNICATION CURRENT LIMIT <sup>(1)(2)</sup>
bq51010B	7-V power supply	v1.1	15 V	7 V	Disabled	Disabled	Disabled	Adaptive + 1s Hold-Off

(1) Enabled if EN2 is low and disabled if EN2 is high

(2) Communication current limit is disabled for 1 second at start-up

## 6 Pin Configuration and Functions

**YFP Package  
28-Pin DSBGA  
Top View**

## Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AC1	B3, B4	I	AC input from receiver coil antenna.
AC2	B1, B2	I	
AD	G4	I	Connect this pin to the wired adapter input. When a voltage is applied to this pin wireless charging is disabled and AD_EN is driven low. Connect to GND through a 1-μF capacitor. If unused, capacitor is not required and must be grounded directly.
$\overline{\text{AD-EN}}$	F3	O	Push-pull driver for external PFET connecting AD and OUT. This node is pulled to the higher of OUT and AD when turning off the external FET. This voltage tracks approximately 4 V below AD when voltage is present at AD and provides a regulated VSG bias for the external FET. Float this pin if unused.
BOOT1	C4	O	Bootstrap capacitors for driving the high-side FETs of the synchronous rectifier. Connect a 10-nF ceramic capacitor from BOOT1 to AC1 and from BOOT2 to AC2.
BOOT2	C1	O	
CLMP1	E3	O	Open drain FETs are used for a non-power dissipative overvoltage AC clamp protection. When the RECT voltage goes above 15 V, both switches is turned on and the capacitors acts as a low impedance to protect the IC from damage. If used, Clamp1 is required to be connected to AC1, and Clamp2 is required to be connected to AC2 through 0.47-μF capacitors.
CLMP2	E2	O	
COM1	E4	O	Open-drain output used to communicate with primary by varying reflected impedance. Connect through a capacitor to either AC1 or AC2 for capacitive load modulation (COM2 must be connected to the alternate AC1 or AC2 pin). For resistive modulation connect COM1 and COM2 to RECT through a single resistor; connect through separate capacitors for capacitive load modulation.
COM2	E1	O	
EN1	G3	I	Inputs that allow user to enable or disable wireless and wired charging <EN1 EN2>: <00> wireless charging is enabled unless AD voltage > 3.6 V <01> <a href="#">Dynamic</a> communication current limit disabled <10> AD-EN pulled low, wireless charging disabled <11> wired and wireless charging disabled.
EN2	G2	I	
FOD	F2	I	
ILIM	G1	I/O	Input for the received power measurement. Connect to GND with a 140-Ω resistor. See the FOD section for more detail.
OUT	D1, D2, D3, D4	O	Programming pin for the over current limit. Connect external resistor to VSS. Size $R_{ILIM}$ with the following equation: $R_{ILIM} = 314 / I_{MAX}$ where $I_{MAX}$ is the expected maximum output current of the wireless power supply. The hardware current limit (ILIM) is 20% greater than IMAX or $1.2 \times I_{MAX}$ . If the supply is meant to operate in current limit use: $R_{ILIM} = 314 / I_{ILIM}$ , $R_{ILIM} = R1 + R_{FOD}$
PGND	A1, A2, A3, A4	—	Output pin, delivers power to the load.
RECT	C2, C3	O	Power ground
TS/CTRL	F1	I	Filter capacitor for the internal synchronous rectifier. Connect a ceramic capacitor to PGND. Depending on the power levels, the value may be 4.7 μF to 22 μF.
$\overline{\text{WPG}}$	F4	O	Must be connected to ground through a resistor. If an NTC function is not desired connect to GND with a 10-kΩ resistor. As a CTRL pin pull to ground to send end power transfer (EPT) fault to the transmitter or pull-up to an internal rail (that is, 1.8 V) to send EPT termination to the transmitter. Note that a 3-state driver must be used to interface this pin (see the <a href="#">3-State Driver Recommendations For the TS-CTRL Pin</a> section for further description)
			Open-drain output – Active when the output of the wireless power supply is enabled.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

		MIN	MAX	UNIT
Input voltage	AC1, AC2	−0.8	20	V
	RECT, COM1, COM2, OUT, $\overline{\text{WPG}}$ , CLAMP1, CLAMP2	−0.3	20	
	AD, $\overline{\text{AD-EN}}$	−0.3	30	
	BOOT1, BOOT2	−0.3	26	
	EN1, EN2, TERM, FOD, TS-CTRL, ILIM	−0.3	7	
Input current	AC1, AC2		1.5	A(RMS)
Output current	OUT		750	mA
Output sink current	$\overline{\text{WPG}}$		15	mA
	COM1, COM2		1	A
Junction temperature, $T_J$		−40	150	°C
Storage temperature, $T_{\text{stg}}$		−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the VSS terminal, unless otherwise noted.

### 7.2 ESD Ratings

		VALUE	UNIT
$V_{\text{(ESD)}}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
$V_{\text{RECT}}$	Voltage range	RECT	4	10	V
$I_{\text{RECT}}$	Current through internal rectifier	RECT		1	A
$I_{\text{OUT}}$	Output current	OUT		750	mA
$I_{\text{AD-EN}}$	Sink current	$\overline{\text{AD-EN}}$		1	mA
$I_{\text{COMM}}$	COMM sink current	COMM		400	mA
$T_J$	Junction temperature		0	125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		bq51010B	UNIT
		YFP (DSBGA)	
		28 PINS	
$R_{\theta\text{JA}}$	Junction-to-ambient thermal resistance	58.9	°C/W
$R_{\theta\text{JC(top)}}$	Junction-to-case (top) thermal resistance	0.2	°C/W
$R_{\theta\text{JB}}$	Junction-to-board thermal resistance	9.1	°C/W
$\psi_{\text{JT}}$	Junction-to-top characterization parameter	1.4	°C/W
$\psi_{\text{JB}}$	Junction-to-board characterization parameter	8.9	°C/W
$R_{\theta\text{JC(bot)}}$	Junction-to-case (bottom) thermal resistance	—	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

over operating free-air temperature range, 0°C to 125°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
UVLO	Undervoltage lockout	$V_{RECT} = 0\text{ V to }3\text{ V}$	2.6	2.7	2.8	V
$V_{HYS}$	Hysteresis on UVLO	$V_{RECT} = 3\text{ V to }2\text{ V}$		250		mV
	Hysteresis on OVP	$V_{RECT} = 16\text{ V to }5\text{ V}$		150		
$V_{RECT}$	Input overvoltage threshold	$V_{RECT} = 5\text{ V to }16\text{ V}$	14.5	15	15.5	V
$V_{RECT-REG}$	Dynamic $V_{RECT}$ threshold 1	$I_{LOAD} < 0.1 \times I_{IMAX}$ ( $I_{LOAD}$ rising)		9.08		V
	Dynamic $V_{RECT}$ threshold 2	$0.1 \times I_{IMAX} < I_{LOAD} < 0.2 \times I_{IMAX}$ ( $I_{LOAD}$ rising)		8.28		
	Dynamic $V_{RECT}$ threshold 3	$0.2 \times I_{IMAX} < I_{LOAD} < 0.4 \times I_{IMAX}$ ( $I_{LOAD}$ rising)		7.53		
	Dynamic $V_{RECT}$ threshold 4	$I_{LOAD} > 0.4 \times I_{IMAX}$ ( $I_{LOAD}$ rising)		7.11		
	$V_{RECT}$ tracking	In current limit voltage above $V_{OUT}$		$V_O + 0.25$		
$I_{LOAD}$	$I_{LOAD}$ hysteresis for dynamic $V_{RECT}$ thresholds as a percentage of $I_{ILIM}$	$I_{LOAD}$ falling		4%		
$V_{RECT-DPM}$	Rectifier undervoltage protection, restricts $I_{OUT}$ at $V_{RECT-DPM}$		3	3.1	3.2	V
$V_{RECT-REV}$	Rectifier reverse voltage protection at the output	$V_{RECT-REV} = V_{OUT} - V_{RECT}$ , $V_{OUT} = 10\text{ V}$		8	9	V
<b>QUIESCENT CURRENT</b>						
$I_{RECT}$	Active chip quiescent current consumption from RECT	$I_{LOAD} = 0\text{ mA}$ , $0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$		8	10	mA
		$I_{LOAD} = 300\text{ mA}$ , $0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$		2	3	
$I_{OUT}$	Quiescent current at the output when wireless power is disabled (standby)	$V_{OUT} = 7\text{ V}$ , $0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$		28	40	$\mu\text{A}$
<b><math>I_{LIM}</math> SHORT CIRCUIT</b>						
$R_{ILIM}$	Highest value of $I_{LIM}$ resistor considered a fault (short). Monitored for $I_{OUT} > 100\text{ mA}$	$R_{ILIM} = 200\ \Omega$ to $50\ \Omega$ . $I_{OUT}$ latches off, cycle power to reset			120	$\Omega$
$t_{DGL}$	Deglint time transition from $I_{LIM}$ short to $I_{OUT}$ disable			1		ms
$I_{LIM\_SC}$	$I_{LIM\_SHORT\_OK}$ enables the $I_{LIM}$ short comparator when $I_{OUT}$ is greater than this value	$I_{LOAD} = 0\text{ mA to }200\text{ mA}$	110	145	165	mA
	Hysteresis for $I_{LIM\_SHORT\_OK}$ comparator	$I_{LOAD} = 0\text{ mA to }200\text{ mA}$		30		
$I_{OUT}$	Maximum output current limit, $C_L$	Maximum $I_{LOAD}$ that is delivered for 1 ms when $I_{LIM}$ is shorted			2.45	A
<b>OUTPUT</b>						
$V_{OUT-REG}$	Regulated output voltage	$I_{LOAD} = 750\text{ mA}$	6.9	6.96	7.02	V
		$I_{LOAD} = 10\text{ mA}$	6.9	6.95	7.05	
$K_{ILIM}$	Current programming factor for hardware protection	$R_{LIM} = K_{ILIM} / I_{ILIM}$ , where $I_{ILIM}$ is the hardware current limit. $I_{OUT} = 750\text{ mA}$	303	314	322	$\text{A}\Omega$
$K_{IMAX}$	Current programming factor for the nominal operating current	$I_{IMAX} = K_{IMAX} / R_{LIM}$ , where $I_{IMAX}$ is the maximum normal operating current. $I_{OUT} = 750\text{ mA}$		262		$\text{A}\Omega$
$I_{OUT}$	Current limit programming range				1.5	A
$I_{COMM}$	Current limit during WPC communication	$I_{OUT} > 300\text{ mA}$		$I_{OUT} + 50$		mA
		$I_{OUT} < 300\text{ mA}$	343	378	425	
$t_{HOLD}$	Hold off time for the communication current limit during start-up			1		s

## Electrical Characteristics (continued)

over operating free-air temperature range, 0°C to 125°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
TS / CTRL						
V <sub>TS</sub>	Internal TS bias voltage	I <sub>TS-Bias</sub> < 100 μA (periodically driven see t <sub>TS-CTRL</sub> )	2	2.2	2.4	V
V <sub>COLD</sub>	Rising threshold	V <sub>TS</sub> = 50% to 60%	56.5%	58.7%	60.8%	V <sub>TS-Bias</sub>
	Falling hysteresis	V <sub>TS</sub> = 60% to 50%		2%		
V <sub>HOT</sub>	Falling threshold	V <sub>TS</sub> = 20% to 15%	18.5%	19.6%	20.7%	V <sub>TS-Bias</sub>
	Rising hysteresis	V <sub>TS</sub> = 15% to 20%		3%		
V <sub>CTRL</sub>	CTRL pin threshold for a high	V <sub>TS/CTRL</sub> = 50 mV to 150 mV	80	100	130	mV
	CTRL pin threshold for a low	V <sub>TS/CTRL</sub> = 150 mV to 50 mV	50	80	100	
t <sub>TS-CTRL</sub>	Time V <sub>TS-Bias</sub> is active when TS measurements occur	Synchronous to the communication period		24		ms
t <sub>TS</sub>	Deglitch time for all TS comparators			10		ms
R <sub>TS</sub>	Pullup resistor for the NTC network. Pulled up to the voltage bias		18	20	22	kΩ

## 8 Detailed Description

### 8.1 Overview

The principle of the bq51010B wireless power transfer devices are simply to provide an open-cored transformer consisting of transmitter and receiver coils. The transmitter coil and electronics are built into a charger pad, and the receiver coil and electronics are typically built into a portable device such as a cell phone. When the receiver coil is positioned on the transmitter coil, magnetic coupling occurs when the transmitter coil is driven. The flux is coupled into the secondary coil, which induces a voltage and current flows. The secondary voltage is rectified, and power can be transferred effectively to a load wirelessly. Power transfer can be managed through any of the various closed-loop control schemes.

#### 8.1.1 A Brief Description of the Wireless System

A wireless system consists of a charging pad (transmitter or primary) and the secondary-side equipment (receiver or secondary). There is a coil in the charging pad and in the secondary equipment which are magnetically coupled to each other when the secondary is placed on the primary. Power is then transferred from the transmitter to the receiver through coupled inductors (for example, an air-core transformer). Controlling the amount of power transferred is achieved by sending feedback (error signal) communication to the primary (for example, to increase or decrease power).

The receiver communicates with the transmitter by changing the load seen by the transmitter. This load variation results in a change in the transmitter coil current, which is measured and interpreted by a processor in the charging pad. Communication is done through digital-packets which are transferred from the receiver to the transmitter. Differential biphase encoding is used for the packets. The bit rate is 2-kbps.

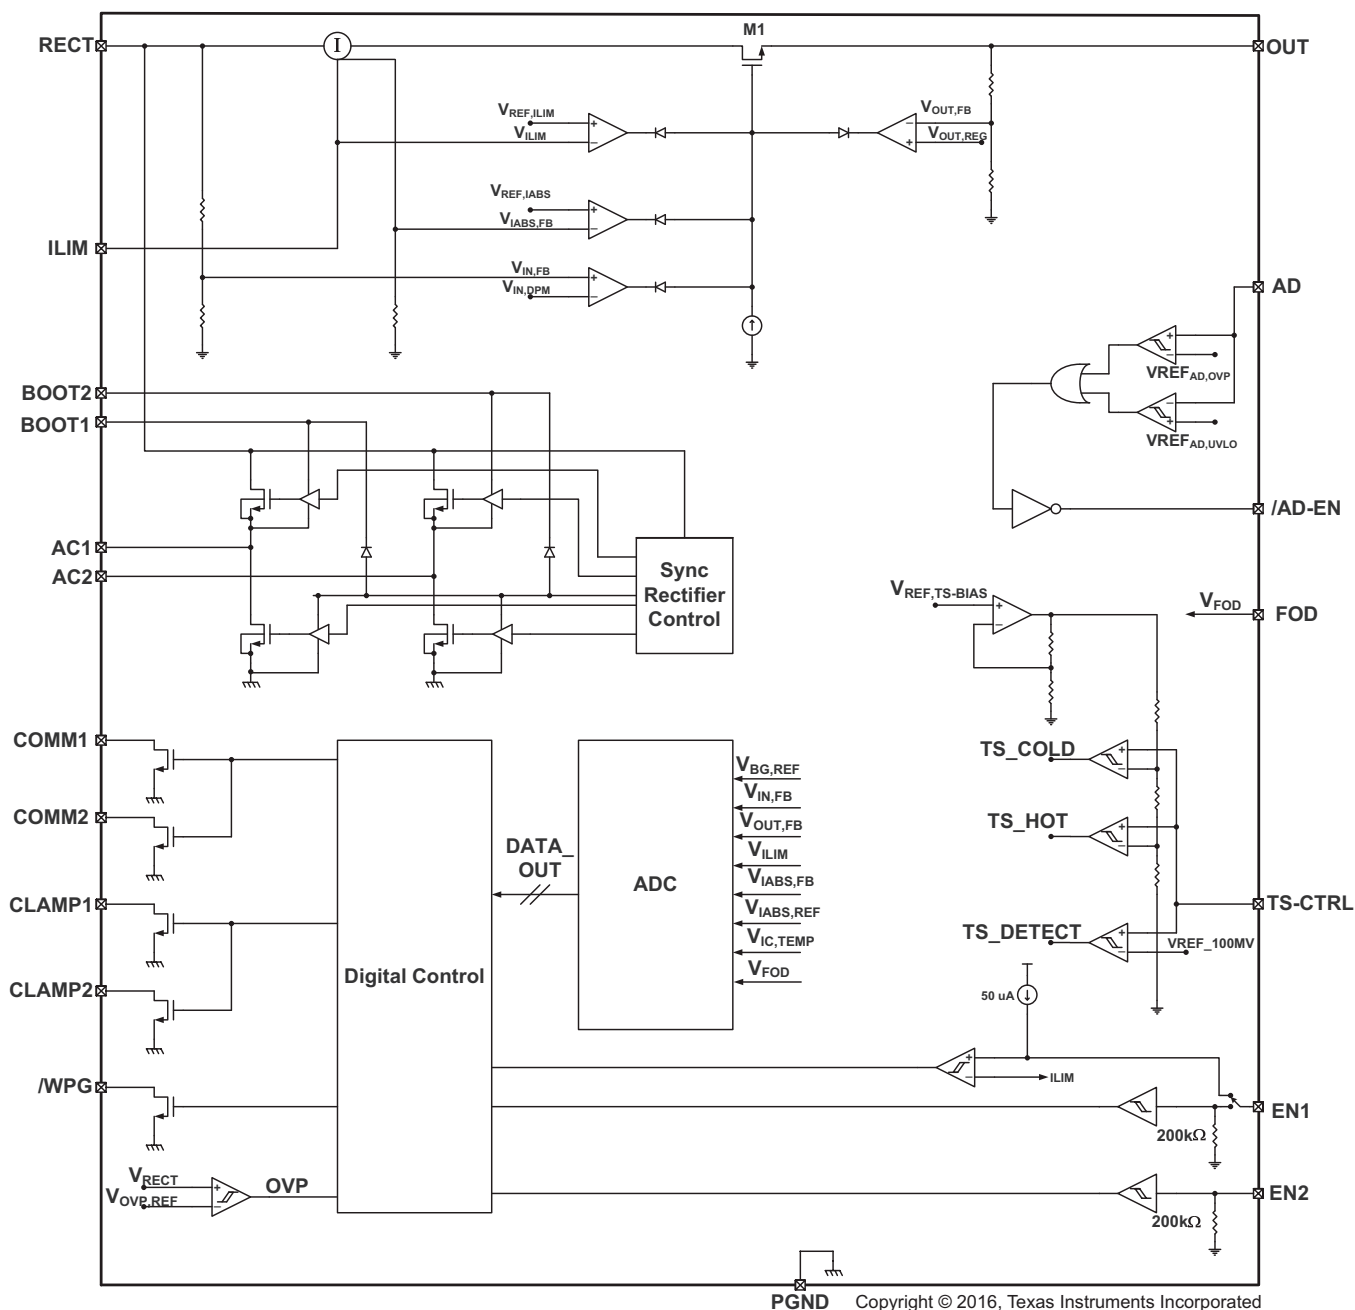

Various types of communication packets have been defined. These include identification and authentication packets, error packets, control packets, end power packets, and power usage packets.

The transmitter coil stays powered off most of the time. It occasionally wakes up to see if a receiver is present. When a receiver authenticates itself to the transmitter, the transmitter remains powered on. The receiver maintains full control over the power transfer using communication packets.

**Figure 12. WPC Wireless Power System Indicating the Functional Integration of the bq51010B**

## 8.2 Functional Block Diagram

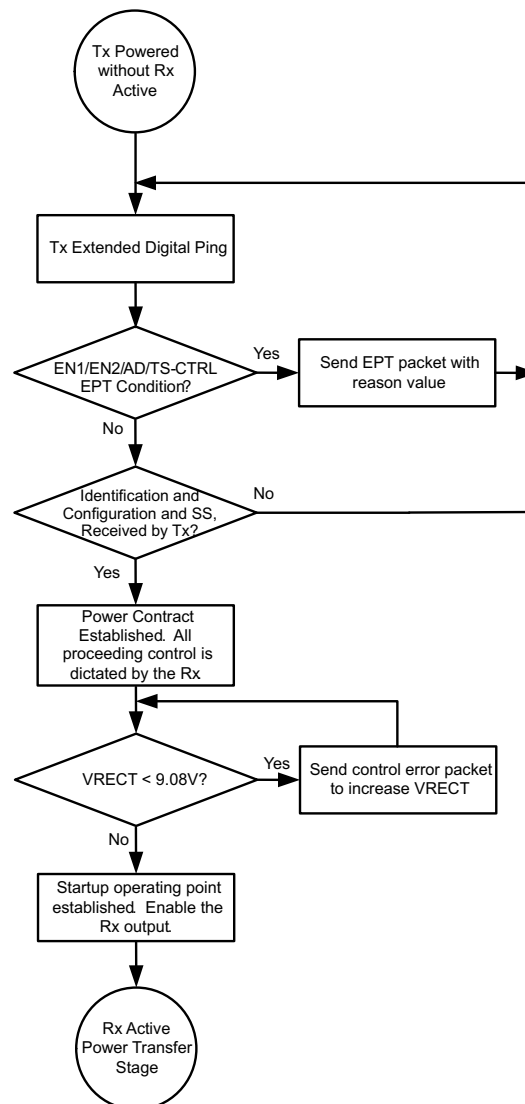

## 8.3 Feature Description

### 8.3.1 Qi Wireless Power System and bq51010B Power Transfer Flow Diagrams

The bq51010B family integrates a fully compliant WPC v1.1 communication algorithm to streamline receiver designs (no extra software development required). Other unique algorithms such as Dynamic Rectifier Control are also integrated to provide best-in-class system performance. This section provides a high-level overview of these features by illustrating the wireless power transfer flow diagram from start-up to active operation.

## Feature Description (continued)

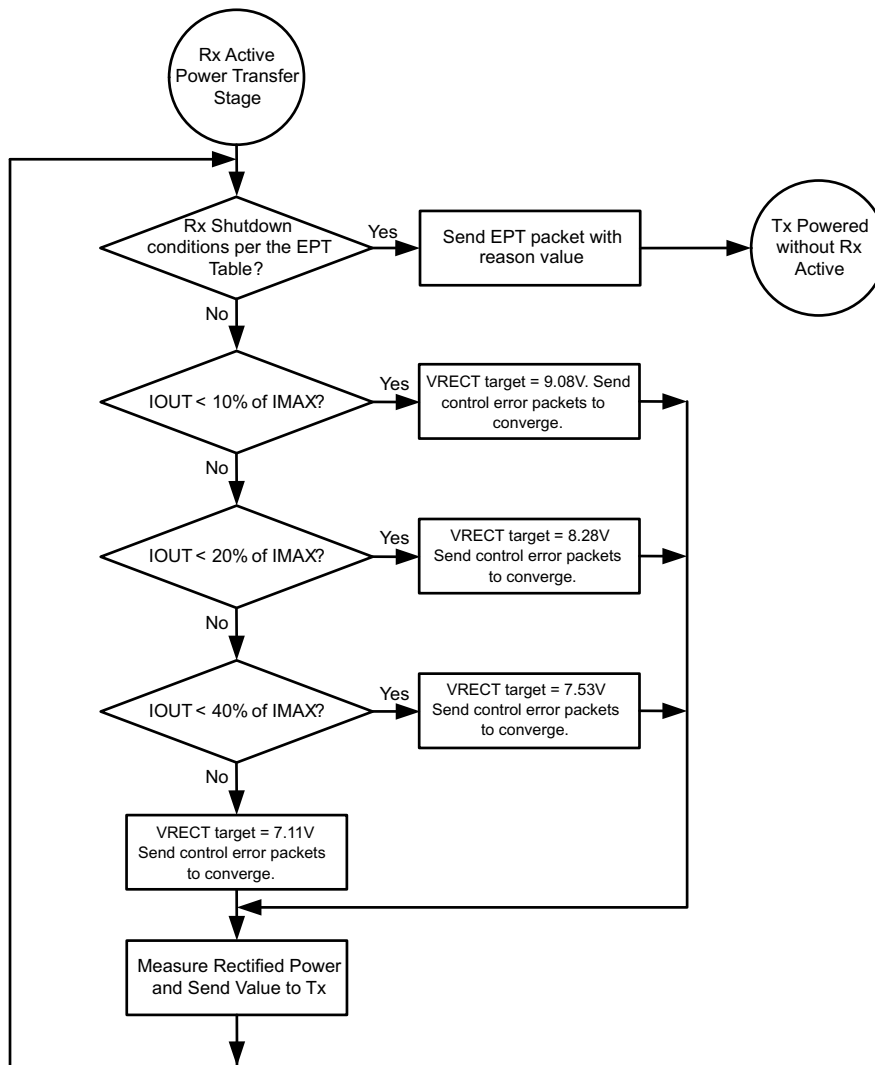

During start-up operation, the wireless power receiver must comply with proper handshaking to be granted a power contract from the TX. The TX initiates the hand shake by providing an extended digital ping. If an RX is present on the TX surface, the RX then provides the signal strength, configuration, and identification packets to the TX (see volume 1 of the WPC specification for details on each packet). These are the first three packets sent to the TX. The only exception is if there is a true shutdown condition on the EN1 or EN2, the AD, or the TS-CTRL pins where the RX shuts down the TX immediately (see [Table 5](#) for details). Once the TX has successfully received the signal strength, configuration, and identification packets, the RX is granted a power contract and is then allowed to control the operating point of the power transfer. With the use of the Dynamic Rectifier Control algorithm, the RX informs the TX to adjust the rectifier voltage above 9 V prior to enabling the output supply. This method enhances the transient performance during system start-up (see [Figure 13](#) for the start-up flow diagram details).

**Figure 13. Wireless Power Start-Up Flow Diagram**

## Feature Description (continued)

Once the start-up procedure has been established, the RX enters the active power transfer stage. This is considered the *main loop* of operation. The Dynamic Rectifier Control algorithm determines the rectifier voltage target based on a percentage of the maximum output current level setting (set by  $K_{IMAX}$  and the  $ILIM$  resistance to GND). The RX sends control error packets to converge on these targets. As the output current changes, the rectifier voltage target dynamically changes. As a note, the feedback loop of the WPC system is relatively slow where it can take up to 90 ms to converge on a new rectifier voltage target. It must be understood that the instantaneous transient response of the system is open loop and dependent on the RX coil output impedance at that operating point. The *main loop* also determines if any conditions in [Table 5](#) are true to discontinue power transfer. See [Figure 14](#) which illustrates the active power transfer loop.

**Figure 14. Active Power Transfer Flow Diagram**

Another requirement of the WPC v1.1 specification is to send the measured received power. This task is enabled on the IC by measuring the voltage on the FOD pin which is proportional to the output current and can be scaled based on the choice of the resistor to ground on the FOD pin.

## Feature Description (continued)

### 8.3.2 Dynamic Rectifier Control

The dynamic rectifier control algorithm offers the end system designer optimal transient response for a given max output current setting. This is achieved by providing enough voltage headroom across the internal regulator at light loads to maintain regulation during a load transient. The WPC system has a relatively slow global feedback loop where it can take more than 90 ms to converge on a new rectifier voltage target. Therefore, the transient response is dependent on the loosely coupled transformers output impedance profile. The dynamic rectifier control allows for a 2-V change in rectified voltage before the transient response is observed at the output of the internal regulator (output of the bq51010B). A 720-mA application allows up to a 1.5-Ω output impedance.

### 8.3.3 Dynamic Efficiency Scaling

The dynamic efficiency scaling feature allows for the loss characteristics of the bq51010B to be scaled based on the maximum expected output power in the end application. This effectively optimizes the efficiency for each application. This feature is achieved by scaling the loss of the internal LDO based on a percentage of the maximum output current. Note that the maximum output current is set by the  $K_{I_{MAX}}$  term and the  $R_{ILIM}$  resistance (where  $R_{ILIM} = K_{I_{MAX}} / I_{MAX}$ ). The flow diagram show in [Figure 14](#) illustrates how the rectifier is dynamically controlled (*Dynamic Rectifier Control*) based on a fixed percentage of the  $I_{MAX}$  setting. [Table 2](#) summarizes how the rectifier behavior is dynamically adjusted based on two different  $R_{ILIM}$  settings.

**Table 2. Dynamic Efficiency Scaling**

OUTPUT CURRENT PERCENTAGE	$R_{ILIM} = 890\ \Omega$ $I_{MAX} = 0.35\ A$	$R_{ILIM} = 417\ \Omega$ $I_{MAX} = 0.75\ A$	$V_{RECT}$
0% to 10%	0 A to 0.035 A	0 A to 0.075 A	9.08 V
10% to 20%	0.035 A to 0.07 A	0.075 A to 0.150 A	8.28 V
20% to 40%	0.07 A to 0.14 A	0.150 A to 0.225 A	7.53 V
>40%	>0.14 A	>0.225 A	7.11 V

### 8.3.4 $R_{ILIM}$ Calculations

The bq51010B includes a means of providing hardware overcurrent protection by means of an analog current regulation loop. The hardware current limit provides an extra level of safety by clamping the maximum allowable output current (for example, a current compliance). The  $R_{ILIM}$  resistor size also sets the thresholds for the dynamic rectifier levels and thus providing efficiency tuning per the maximum system current of each application. Calculate the total  $R_{ILIM}$  resistance with [Equation 1](#).

$$R_{ILIM} = \frac{262}{I_{MAX}}$$

$$I_{ILIM} = 1.2 \times I_{MAX} = \frac{314}{R_{ILIM}}$$

$$R_{ILIM} = R_1 + R_{FOD}$$

where

- $I_{MAX}$  is the expected maximum output current during normal operation
  - $I_{ILIM}$  is the hardware over current limit
- (1)

When referring to the application diagram shown in [Figure 27](#),  $R_{ILIM}$  is the sum of  $R_{FOD}$  and the  $R_1$  resistance (for example, the total resistance from the ILIM pin to GND).

### 8.3.5 Input Overvoltage

If the input voltage suddenly increases in potential (for example, due to a change in position of the equipment on the charging pad), the voltage-control loop inside the bq51010B becomes active, and prevents the output from going beyond  $V_{OUT-REG}$ . The receiver then starts sending back error packets to the transmitter every 30 ms until the input voltage comes back to the  $V_{RECT-REG}$  target, and then maintains the error communication every 250 ms.

If the input voltage increases in potential beyond  $V_{OVP}$ , the IC switches off the LDO and communicates to the primary to bring the voltage back to  $V_{RECT-REG}$ . In addition, a proprietary voltage protection circuit is activated by means of  $C_{CLAMP1}$  and  $C_{CLAMP2}$  that protects the IC from voltages beyond the maximum rating of the IC (for example, 20 V).

### 8.3.6 Adapter Enable Functionality and EN1 or EN2 Control

Figure 32 is an example application that shows the bq51010B used as a wireless power receiver that can power multiplex between wired or wireless power for the down-system electronics. In the default operating mode pins EN1 and EN2 are low, which activates the adapter enable functionality. In this mode, if an adapter is not present the AD pin is low, and AD-EN pin is pulled to the higher of the OUT and AD pins so that the PMOS between OUT and AD is turned off. If an adapter is plugged in and the voltage at the AD pin goes above 3.6 V then wireless charging is disabled and the AD-EN pin is pulled approximately 4 V below the AD pin to connect AD to the secondary charger. The difference between AD and AD-EN is regulated to a maximum of 7V to ensure the  $V_{GS}$  of the external PMOS is protected.

The EN1 and EN2 pins include internal 200-k $\Omega$  pulldown resistors, so that if these pins are not connected bq51010B defaults to AD-EN control mode. However, these pins can be pulled high to enable other operating modes as described in Table 3.

**Table 3. EN/EN2 Control**

EN1	EN2	RESULT
0	0	Adapter control enabled. If adapter is present then secondary charger is powered by adapter, otherwise wireless charging is enabled when wireless power is available. Communication current limit is enabled.
0	1	Disables communication current limit.
1	0	AD-EN is pulled low, whether or not adapter voltage is present. This feature can be used, for example, in USB OTG applications.
1	1	Adapter and wireless charging are disabled, that is, power is never delivered by the OUT pin in this mode.

**Table 4. Adapter Enable Functionality**

EN1	EN2	WIRELESS POWER	WIRED POWER	OTG MODE	ADAPTIVE COMMUNICATION LIMIT	EPT
0	0	Enabled	Priority <sup>(1)</sup>	Disabled	Enabled	Not Sent to TX
0	1	Priority <sup>(1)</sup>	Enabled	Disabled	Disabled	Not Sent to TX
1	0	Disabled	Enabled	Enabled <sup>(2)</sup>	—	No Response
1	1	Disabled	Disabled	Disabled	—	Termination

(1) If both wired and wireless power are present, wired power is given priority.

(2) Allows for a boost-back supply to be driven from the output terminal of the RX to the adapter port through the external back-to-back PMOS FET.

As described in Table 4, pulling EN2 high disables the adapter mode and only allows wireless charging. In this mode the adapter voltage is always blocked from the OUT pin. An application example where this mode is useful is when USB power is present at AD, but the USB is in suspend mode so that no power can be taken from the USB supply. Pulling EN1 high enables the off-chip PMOS regardless of the presence of a voltage. This function can be used in USB OTG mode to allow a charger connected to the OUT pin to power the AD pin. Finally, pulling both EN1 and EN2 high disables both wired and wireless charging.

#### NOTE

It is required to connect a back-to-back PMOS between AD and OUT so that voltage is blocked in both directions. Also, when AD mode is enabled no load can be pulled from the RECT pin as this could cause an internal device overvoltage in bq51010B.

### 8.3.7 End Power Transfer Packet (WPC Header 0x02)

The WPC allows for a special command for the receiver to terminate power transfer from the transmitter termed End Power Transfer (EPT) packet. Table 5 specifies the v1.1 reasons column and their corresponding data field value. The condition column corresponds to the methodology used by bq51010B to send equivalent message.

**Table 5. End Power Transfer Packet**

MESSAGE	VALUE	CONDITION
Unknown	0x00	AD > 3.6 V
Charge Complete	0x01	TS/CTRL = 1, or EN1 = 1, or <EN1 EN2> = <11>
Internal Fault	0x02	$T_J > 150^{\circ}\text{C}$ or $R_{ILIM} < 100\ \Omega$
Over Temperature	0x03	$TS < V_{HOT}$ , $TS > V_{COLD}$ , or $TS/CTRL < 100\ \text{mV}$
Over Voltage	0x04	Not Sent
Over Current	0x05	NOT USED
Battery Failure	0x06	Not Sent
Reconfigure	0x07	Not Sent
No Response	0x08	VRECT target doesn't converge

### 8.3.8 Status Outputs

The bq51010B has one status output,  $\overline{\text{WPG}}$ . This output is an open-drain NMOS device that is rated to 20 V. The open-drain FET connected to the  $\overline{\text{WPG}}$  pin is turned on whenever the output of the power supply is enabled. The output of the power supply is not enabled if the  $V_{\text{RECT-REG}}$  does not converge at the no-load target voltage.

### 8.3.9 WPC Communication Scheme

The WPC communication uses a modulation technique termed *back-scatter modulation* where the receiver coil is dynamically loaded to provide amplitude modulation of the coil voltage and current of the transmitter. This scheme is possible due to the fundamental behavior between two loosely coupled inductors (for example, between the TX and RX coil). This type of modulation can be accomplished by switching in and out a resistor at the output of the rectifier, or by switching in and out a capacitor across the AC1/AC2 net. Figure 15 shows how to implement resistive modulation.

**Figure 15. Resistive Modulation**

Figure 16 shows how to implement capacitive modulation.

**Figure 16. Capacitive Modulation**

The amplitude change in TX coil voltage or current can be detected by the transmitters decoder. Figure 17 shows the resulting signal observed by the TX.

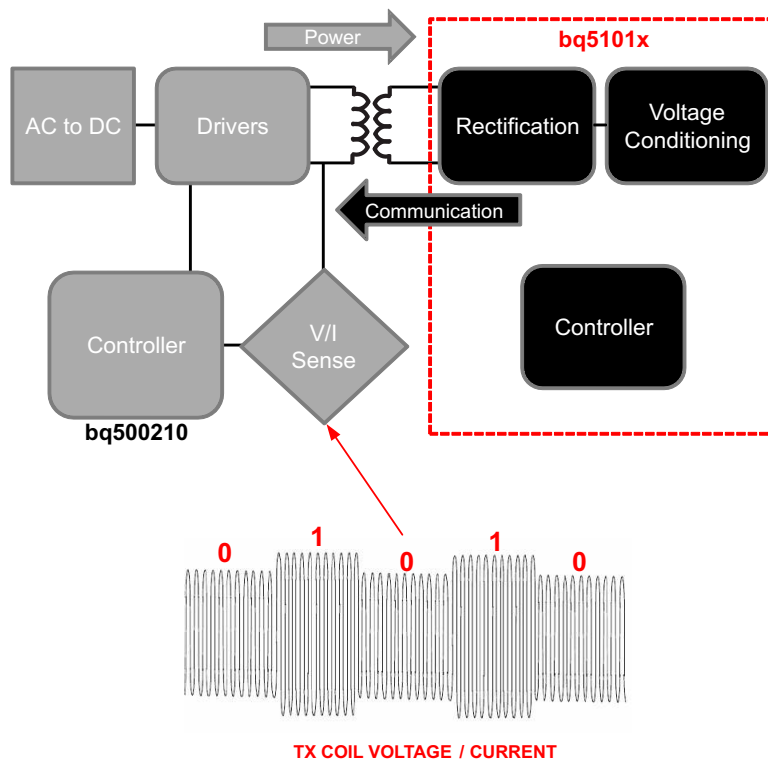

Figure 17. TX Coil Voltage and Current

The WPC protocol uses a differential biphas encoding scheme to modulate the data bits onto the TX coil voltage and current. Each data bit is aligned at a full period of 0.5 ms ( $t_{CLK}$ ) or 2 kHz. An encoded ONE results in two transitions during the bit period and an encoded ZERO results in a single transition. See Figure 18 for an example of the differential biphas encoding.

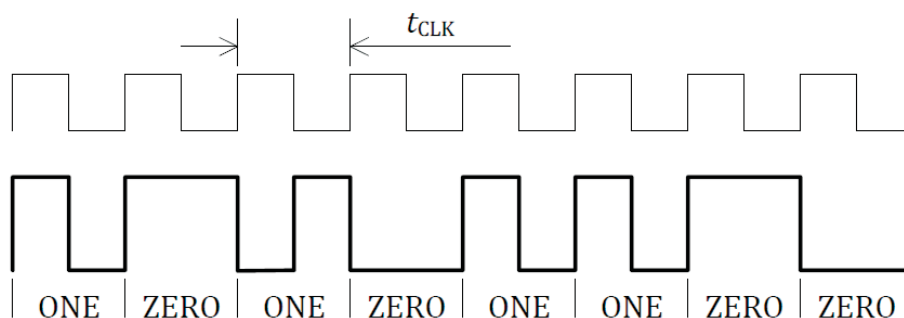

Figure 18. Differential Biphas Encoding Scheme (WPC volume 1: Low Power, Part 1 Interface Definition)

The bits are sent LSB first and use an 11-bit asynchronous serial format for each portion of the packet. This includes one start bit, n-data bytes, a parity bit, and a single stop bit. The start bit is always ZERO and the parity bit is odd. The stop bit is always ONE. Figure 19 shows the details of the asynchronous serial format.

Figure 19. Asynchronous Serial Formatting (WPC volume 1: Low Power, Part 1 Interface Definition)

Each packet format is organized as shown in [Figure 20](#).

**Figure 20. Packet Format (WPC volume 1: Low Power, Part 1 Interface Definition)**

### 8.3.10 Communication Modulator

The bq51010B provides two identical, integrated communication FETs which are connected to the pins COM1 and COM2. These FETs are used for modulating the secondary load current which allows bq51010B to communicate error control and configuration information to the transmitter. [Figure 21](#) below shows how the COMM pins can be used for resistive load modulation. Each COMM pin can handle at most a 24- $\Omega$  communication resistor. Therefore, if a COMM resistor between 12  $\Omega$  and 24  $\Omega$  is required COM1 and COM2 pins must be connected in parallel. bq51010B does not support a COMM resistor less than 12  $\Omega$ .

**Figure 21. Resistive Load Modulation**

In addition to resistive load modulation, the bq51010B is also capable of capacitive load modulation as shown in [Figure 22](#) below. In this case, a capacitor is connected from COM1 to AC1 and from COM2 to AC2. When the COMM switches are closed there is effectively a 22-nF capacitor connected between AC1 and AC2. Connecting a capacitor in between AC1 and AC2 modulates the impedance seen by the coil, which is reflected in the primary as a change in current.

Figure 22. Capacitive Load Modulation

### 8.3.11 Adaptive Communication Limit

The Qi communication channel is established through backscatter modulation as described in the previous sections. This type of modulation takes advantage of the loosely coupled inductor relationship between the RX and TX coil. Essentially the switching in-and-out of the communication capacitor or resistor adds a transient load to the RX coil to modulate the TX coil voltage or current waveform (amplitude modulation). The consequence of this technique is that a load transient (load current noise) from the mobile device has the same signature. To provide noise immunity to the communication channel, the output load transients must be isolated from the RX coil. The proprietary feature *adaptive communication limit* achieves this by dynamically adjusting the current limit of the regulator. When the regulator is put in current limit, any load transients is offloaded to the battery in the system.

Note that this requires the battery charger IC to have input voltage regulation (weak adapter mode). The output of the RX appears as a weak supply if a transient occurs above the current limit of the regulator.

The adaptive communication limit feature has two current limit modes listed in [Table 6](#).

Table 6. Adaptive Communication Limit

$I_{OUT}$	COMMUNICATION CURRENT LIMIT
< 300 mA	Fixed 400 mA
> 300 mA	$I_{OUT} + 50$ mA

### 8.3.12 Synchronous Rectification

The bq51010B provides an integrated, self-driven synchronous rectifier that enables high-efficiency AC to DC power conversion. The rectifier consists of an all NMOS H-Bridge driver where the backgates of the diodes are configured to be the rectifier when the synchronous rectifier is disabled. During the initial start-up of the WPC system the synchronous rectifier is not enabled. At this operating point, the DC rectifier voltage is provided by the diode rectifier. Once  $V_{RECT}$  is greater than  $UVLO$ , half-synchronous mode is enabled until the load current surpasses 120 mA. Above 120 mA, the full synchronous rectifier stays enabled until the load current drops back below 100 mA where half-synchronous mode is enabled instead.

### 8.3.13 Temperature Sense Resistor Network (TS)

bq51010B includes a ratiometric external temperature sense function. The temperature sense function has two ratiometric thresholds which represent a hot and cold condition. TI recommends an external temperature sensor to provide safe operating conditions for the receiver product. This pin is best used for monitoring the surface that can be exposed to the end user (for example, place the NTC resistor closest to the user).

Figure 23 allows for any NTC resistor to be used with the given  $V_{HOT}$  and  $V_{COLD}$  thresholds.

**Figure 23. NTC Circuit Used for Safe Operation of the Wireless Receiver Power Supply**

The resistors  $R_1$  and  $R_3$  can be solved by resolving the system of equations at the desired temperature thresholds (see Equation 2 and Equation 3).

$$\begin{aligned} \%V_{COLD} &= \frac{\left( \frac{R_3 (R_{NTC|TCOLD} + R_1)}{R_3 + (R_{NTC|TCOLD} + R_1)} \right)}{\left( \frac{R_3 (R_{NTC|TCOLD} + R_1)}{R_3 + (R_{NTC|TCOLD} + R_1)} \right) + R_2} \times 100 \\ \%V_{HOT} &= \frac{\left( \frac{R_3 (R_{NTC|THOT} + R_1)}{R_3 + (R_{NTC|THOT} + R_1)} \right)}{\left( \frac{R_3 (R_{NTC|THOT} + R_1)}{R_3 + (R_{NTC|THOT} + R_1)} \right) + R_2} \times 100 \end{aligned} \quad (2)$$

$$R_{NTC|TCOLD} = R_O e^{\beta \left( \frac{1}{TCOLD} - \frac{1}{T_O} \right)}$$

$$R_{NTC|THOT} = R_O e^{\beta \left( \frac{1}{THOT} - \frac{1}{T_O} \right)}$$

where

- $T_{COLD}$  and  $T_{HOT}$  are the desired temperature thresholds in degrees Kelvin
- $R_O$  is the nominal resistance
- $\beta$  is the temperature coefficient of the NTC resistor
- $R_O$  is fixed at 20 kΩ

(3)

An example solution is provided:

- $R_1 = 4.23 \text{ k}\Omega$
- $R_3 = 66.8 \text{ k}\Omega$

Where the chosen parameters are:

- $\%V_{\text{HOT}} = 19.6\%$
- $\%V_{\text{COLD}} = 58.7\%$
- $T_{\text{COLD}} = -10^\circ\text{C}$
- $T_{\text{HOT}} = 100^\circ\text{C}$
- $\beta = 3380$
- $R_O = 10 \text{ k}\Omega$

Figure 24 shows the plot of the percent  $V_{\text{TSB}}$  vs temperature.

**Figure 24. Example Solution for an NTC resistor with  $R_O = 10 \text{ k}\Omega$  and  $\beta = 4500$**

Figure 25 illustrates the periodic biasing scheme used for measuring the TS state. The TS\_READ signal enables the TS bias voltage for 24 ms. During this period the TS comparators are read (each comparator has a 10 ms deglitch) and appropriate action is taken based on the temperature measurement. After this 24 ms period has elapsed, the TS\_READ signal goes low, which causes the TS-Bias pin to become high impedance. During the next 35 ms (priority packet period) or 235 ms (standard packet period), the TS voltage is monitored and compared to 100 mV. If the TS voltage is greater than 100 mV then a secondary device is driving the TS or CTRL pin and a CTRL = 1 is detected.

### 8.3.15 Thermal Protection

The bq51010B includes a thermal shutdown protection. If the die temperature reaches  $T_{J(ON)}$ , the LDO is shut off to prevent any further power dissipation. In this case bq51010B sends an EPT message of internal fault (0x02).

### 8.3.16 WPC 1.1 Compliance – Foreign Object Detection

The bq51010B is a WPC 1.1 compatible device. To enable a power transmitter to monitor the power loss across the interface as one of the possible methods to limit the temperature rise of foreign objects, the bq51010B reports its received power to the power transmitter. The received power equals the power that is available from the output of the power receiver plus any power that is lost in producing that output power (the power loss in the secondary coil and series resonant capacitor, the power loss in the shielding of the power receiver, the power loss in the rectifier). In WPC1.1 specification, foreign object detection (FOD) is enforced. This means the bq51010B sends received power information with known accuracy to the transmitter.

WPC 1.1 defines received power as “the average amount of power that the power receiver receives through its interface surface, in the time window indicated in the configuration packet”.

To receive certification as a WPC 1.1 receiver, the Device Under Test (DUT) is tested on a reference transmitter whose transmitted power is calibrated, the receiver must send a received power such that [Equation 4](#).

$$0 < (TX\ PWR)_{REF} - (RX\ PWR\ out)_{DUT} < -250\ mW \quad (4)$$

This 250-mW bias ensures that system remains interoperable.

WPC 1.1 transmitter is tested to see if they can detect reference foreign objects with a reference receiver.

WPC 1.1 specification allows much more accurate sensing of foreign objects.

## 8.4 Device Functional Modes

The operational modes of the bq51010B are described in [Feature Description](#). The bq51010B has several functional modes. Start-up refers to the initial power transfer and communication between the receiver (bq51010B circuit) and the transmitter. Power transfer refers to any time that the TX and RX are communicating and power is being delivered from the TX to the RX. Power transfer termination occurs when the RX is removed from the TX, power is removed from the TX or the RX requests power transfer termination.

## 9 Application and Implementation

### NOTE

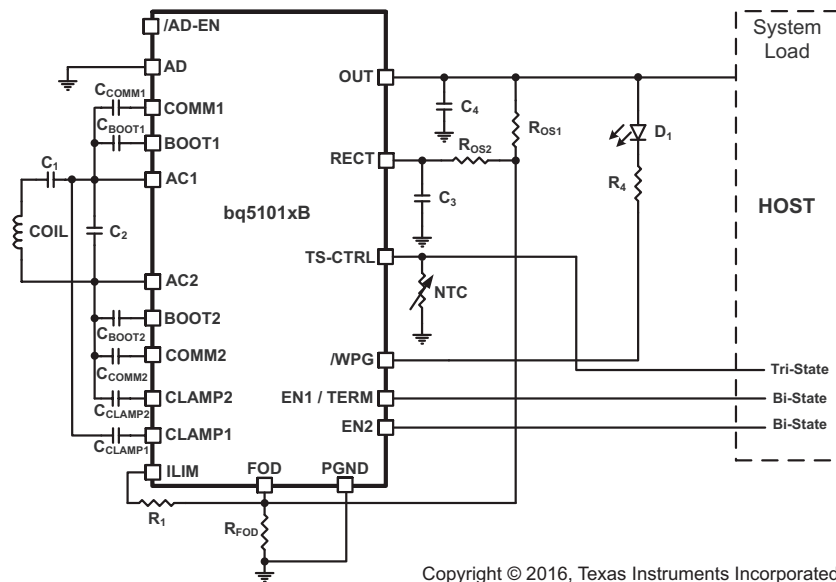

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The bq51010B is a fully integrated, wireless power receiver in a single device. The device complies with the WPC v1.1 specifications for a wireless power receiver. When paired with a WPC v1.1 compliant transmitter, the device can provide up to 5-W of power. There are several tools available for the design of the system. These tools may be obtained by checking the product page at [www.ti.com/product/bq51010B](http://www.ti.com/product/bq51010B).

### 9.2 Typical Applications

#### 9.2.1 bq51010B Wireless Power Receiver Used as a Power Supply

Only one of  $R_{OS1}$  or  $R_{OS2}$  required

**Figure 27. bq51010B Used as a Wireless Power Receiver and Power Supply for System Loads**

#### 9.2.1.1 Design Requirements

This application is for a system that has varying loads from less than 100 mA up to 1 A. The application must work with any Qi-certified transmitter. There is no requirement for any external thermal measurements. An LED indication is required to indicate an active power supply. Each of the components from the application drawing is examined.

#### 9.2.1.2 Detailed Design Procedure

##### 9.2.1.2.1 Using the bq51010B as a Wireless Power Supply

Figure 27 is the schematic of a system which uses the bq51010B as a power supply.

When the system shown in Figure 27 is placed on the charging pad, the receiver coil is inductively coupled to the magnetic flux generated by the coil in the charging pad, which consequently induces a voltage in the receiver coil. The internal synchronous rectifier feeds this voltage to the RECT pin, which has the filter capacitor C3.

## Typical Applications (continued)

The bq51010B identifies and authenticates itself to the primary using the COMM pins by switching on and off the COMM FETs and hence switching in and out  $C_{COMM}$ . If the authentication is successful, the transmitter remains powered on. The bq51010B measures the voltage at the RECT pin, calculates the difference between the actual voltage and the desired voltage  $V_{RECT-REG}$ , (threshold 1 at no load) and sends back error packets to the primary. Dynamic  $V_{RECT}$  thresholds are shown in [Electrical Characteristics](#). This process goes on until the input voltage settles at  $V_{RECT-REG}$ . During a load transient, the dynamic rectifier algorithm sets the targets specified by  $V_{RECT-REG}$  thresholds 1, 2, 3, and 4. This algorithm is termed dynamic rectifier control and is used to enhance the transient response of the power supply.

During power up, the LDO is held off until the  $V_{RECT-REG}$  threshold 1 converges. The voltage control loop ensures that the output voltage is maintained at  $V_{OUT-REG}$  to power the system. The bq51010B meanwhile continues to monitor the input voltage and maintains sending error packets to the primary every 250 ms. If a large overshoot occurs, the feedback to the primary speeds up to every 32 ms to converge on an operating point in less time.

### 9.2.1.2.2 Series and Parallel Resonant Capacitor Selection

Shown in [Figure 27](#), the capacitors C1 (series) and C2 (parallel) make up the dual resonant circuit with the receiver coil. These two capacitors must be sized correctly per the WPC v1.1 specification. [Figure 28](#) illustrates the equivalent circuit of the dual resonant circuit.

**Figure 28. Dual Resonant Circuit With the Receiver Coil**

Section 4.2 (Power Receiver Design Requirements) in Part 1 of the WPC v1.1 specification highlights in detail the sizing requirements. To summarize, the receiver designer is required take inductance measurements with a fixed test fixture. [Figure 29](#) shows the test fixture.

**Figure 29. WPC v1.1 Receiver Coil Test Fixture for the Inductance Measurement  $Ls'$  (Copied from System Description Wireless Power Transfer, Volume 1: Low Power, Part 1 Interface Definition, Version 1.1)**

## Typical Applications (continued)

The primary shield is to be 50 mm × 50 mm × 1 mm of Ferrite material PC44 from TDK Corp. The gap  $d_z$  is to be 3.4 mm. The receiver coil, as it is placed in the final system (for example, the back cover and battery must be included if the system calls for this), is to be placed on top of this surface and the inductance is to be measured at 1-V RMS and a frequency of 100 kHz. This measurement is termed  $L_s'$ . The same measurement is to be repeated without the test fixture shown in [Figure 8](#). This measurement is termed  $L_s$  or the free-space inductance. Each capacitor can then be calculated using [Equation 5](#).

$$C_1 = \left[ (f_s \times 2\pi)^2 \times L_s' \right]^{-1}$$

$$C_2 = \left[ (f_D \times 2\pi)^2 \times L_s - \frac{1}{C_1} \right]^{-1}$$

where

- $f_s$  is 100 kHz +5/-10%
- $f_D$  is 1 MHz ±10%

(5)

$C_1$  must be chosen first prior to calculating  $C_2$ .

The quality factor must be greater than 77 and can be determined by [Equation 6](#).

$$Q = \frac{2\pi \cdot f_D \cdot L_s}{R}$$

where

- $R$  is the DC resistance of the receiver coil

(6)

All other constants are defined above.

### 9.2.1.2.3 COMM, CLAMP, and BOOT Capacitors

For most applications, the COMM, CLAMP, and BOOT capacitance values is chosen to match the bq51010B.

The BOOT capacitors are used to allow the internal rectifier FETs to turn on and off properly. These capacitors are from AC1 to BOOT1 and from AC2 to BOOT2 and must have a minimum 25-V rating. A 10-nF capacitor with a 25-V rating is chosen.

The CLAMP capacitors are used to aid in the clamping process to protect against overvoltage. These capacitors are from AC1 to CLAMP1 and from AC2 to CLAMP2 and must have a minimum 25-V rating. A 0.47-μF capacitor with a 25-V rating is chosen.

The COMM capacitors are used to facilitate the communication from the RX to the TX. This selection can vary a bit more than the BOOT and CLAMP capacitors. In general, TI recommends a 22-nF capacitor. Based on the results of testing of the communication robustness in the final solution, a change to a 47-nF capacitor may be in order. The larger the capacitor the larger the deviation is on the coil which sends a stronger signal to the TX. This also decreases the efficiency somewhat. In this case, a 22-nF capacitor with a 25-V rating is chosen.

### 9.2.1.2.4 Control Pins and $\overline{WPG}$

This section discusses the pins that control the functions of the bq51010B (AD,  $\overline{AD\_EN}$ , EN1, EN2, and TS or CTRL).

This solution uses wireless power exclusively. The AD pin is tied low to disable wired power interaction. The output pin  $\overline{AD\_EN}$  is left floating.

EN1 and EN2 are tied to the system controller GPIO pins. This allows the system to control the wireless power transfer. Normal operation leaves EN1 and EN2 low or floating (GPIO low or high impedance). EN1 and EN2 have internal pulldown resistors. With both EN1 and EN2 low, wireless power is enabled and power can be transferred whenever the RX is on a suitable TX. The RX system controller can terminate power transfer and send an EPT 0x01 (Charge Complete) by setting EN1=EN2=1. The TX terminates power when the EPT 0x01 is received. The TX continues to test for power transfer, but not engage until the RX requests power. For example, if the TX is the bq500212A, the TX sends digital pings approximately once per 5 seconds. During each ping, the

## Typical Applications (continued)

bq51010B resends the EPT 0x01. Between the pings, the bq500212A goes into low power *sleep* mode reducing power consumption. When the RX system controller determines it is time to resume power transfer (for example, the battery voltage is below its recharge threshold) the controller simply returns EN1 and EN2 to low (or float) states. The next ping of the bq500212A powers the bq51010B which now communicates that it is time to transfer power. The TX and RX communication resumes and power transfer is reinitiated.

The TS or CTRL pin is used as a temperature sensor (with the NTC) and maintain the ability to terminate power transfer through the system controller. In this case, the GPIO is in high impedance for normal NTC (Temperature Sense) control.

The  $\overline{\text{WPG}}$  pin is used to indicate power transfer. A 2.1-V forward bias LED is used for  $D_1$  with a current limiting 1.5-k $\Omega$  series resistor. The LED and resistor are tied from OUT to PGND and  $D_1$  lights during power transfer.

### 9.2.1.2.5 Current Limit and FOD

The current limit and foreign object detection functions are related. The current limit is set by  $R_1 + R_{\text{FOD}}$ .  $R_{\text{FOD}}$  and  $R_{\text{os}}$  are determined by FOD calibration. Default values of 20 k $\Omega$  for  $R_{\text{os}}$  (to RECT,  $R_{\text{os}2}$ .  $R_{\text{os}1}$  is not populated). 200  $\Omega$  for  $R_{\text{FOD}}$  are used. The final values required to be determined based on the FOD calibration. The tool for FOD calibration can be found on the bq51010B web folder under *Tools & Software*. Good practice is to set the layout with 2 resistors for  $R_{\text{os}}$  and 2 for  $R_{\text{FOD}}$  to allow for precise values once the calibration is complete.

After setting  $R_{\text{FOD}}$ ,  $R_1$  can be calculated based on the desired current limit. The maximum current for this solution under normal operating conditions ( $I_{\text{MAX}}$ ) is 714 mA. Using Equation 1 to calculate the maximum current yields a value of 367  $\Omega$  for  $R_{\text{ILIM}}$ . With  $R_{\text{FOD}}$  set to 200  $\Omega$  the remaining resistance for  $R_1$  is 167  $\Omega$ . Choose the closest standard resistor of 165  $\Omega$ . This also sets the hardware current limit to 856 mA to allow for temporary current surges without system performance concerns.

### 9.2.1.2.6 RECT and OUT Capacitance

RECT capacitance is used to smooth the AC to DC conversion and to prevent minor current transients from passing to OUT. For this 714-mA  $I_{\text{MAX}}$ , select two 10- $\mu\text{F}$  capacitors and one 0.1- $\mu\text{F}$  capacitor. These must be rated to 16 V.

OUT capacitance is used to reduce any ripple from minor load transients. For this solution, a single 10- $\mu\text{F}$  capacitor and a single 0.1- $\mu\text{F}$  capacitor are used.

### 9.2.1.3 Application Curves

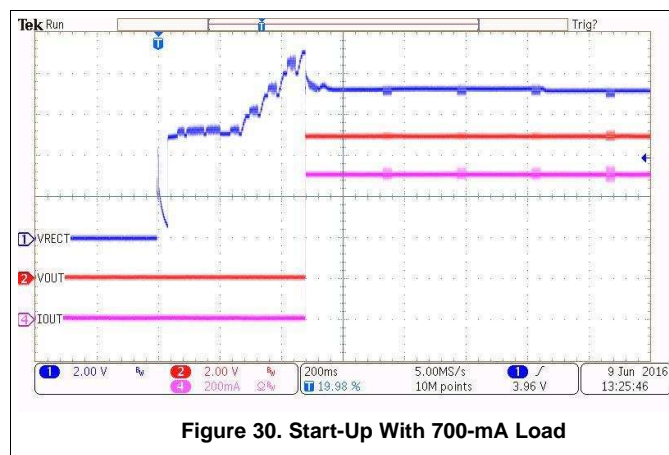

Figure 30. Start-Up With 700-mA Load

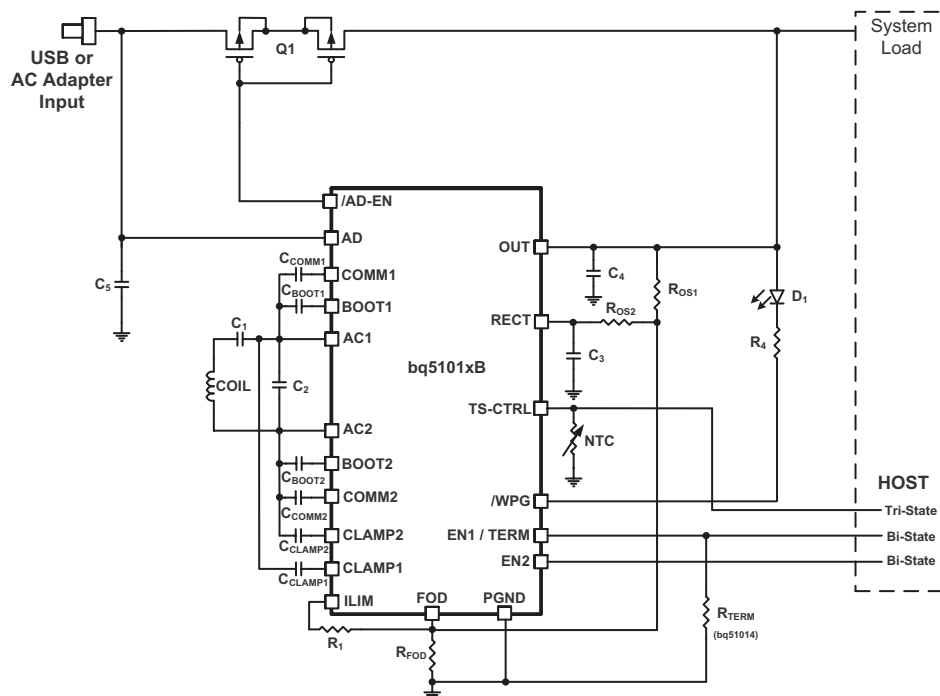

Figure 31. Load Transitions (0.7 A to 0.1 A to 0.7 A)

## Typical Applications (continued)

### 9.2.2 Dual Power Path: Wireless Power and DC Input

Copyright © 2016, Texas Instruments Incorporated

Only one of  $R_{OS1}$  or  $R_{OS2}$  required

**Figure 32. bq51010B Used as a Wireless Power Receiver and Power Supply for System Loads With Adapter Power-Path Multiplexing**

#### 9.2.2.1 Design Requirements

This solution adds the ability to disable wireless charging with the AD and  $\overline{AD\_EN}$  pins. A DC supply (USB or AC adapter with DC output) can also be used to power the subsystem. This can occur during wireless power transfer or without wireless power transfer. The system must allow power transfer without any backflow or damage to the circuitry.

#### 9.2.2.2 Detailed Design Procedure

The basic components used in Figure 27 are reused here in Figure 32. The additional circuitry needed for source control will be discussed. Adding a blocking FET while using the bq51010B for control is the only addition to the circuitry. The AD pin is tied to the DC input as a threshold detector. The  $\overline{AD\_EN}$  pin is used to enable or disable the blocking FET. The blocking FET must be chosen to handle the appropriate current level and the DC voltage level supplied from the input. In this example, the expectation is that the DC input is 7 V with a maximum current of 700 mA (same configuration as the wireless power supply). The CSD75207W15 is a good fit because it is a P-Channel, –20-V, 3.9-A FET pair in a 1.5-mm<sup>2</sup> WCSP.

#### 9.2.2.3 Application Curves

The following scope plots show behavior under different conditions.

Figure 33 shows the transition from wireless power to wired power when power is added to the AD pin.  $V_{RECT}$  drops and there is a short time ( $I_{OUT}$  drops to zero) when neither source is providing power. When Q1 is enabled (through  $\overline{AD\_EN}$ ) the output current turns back on. Note the RECT voltage after about 500 ms. This is the TX sending a ping to check to see if power is required. RECT returns to low after the bq51010B informs the TX it does not required power (without enabling the OUT pin). This timing is based on the TX (bq500212A used here).

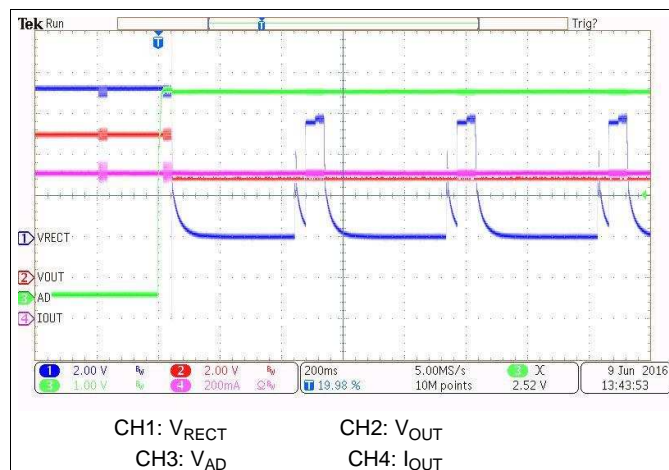

## Typical Applications (continued)

**Figure 34** shows the transition to wireless power when the AD voltage is removed. Note that after wired power is removed, the next ping from bq500212A energizes the bq51010B. Once the rectifier voltage is stable the output turns on.

**Figure 35** shows a system placed onto the transmitter with AD already powered. The TX sends a ping which the RX responds to and informs the TX that no power is required. The ping continues with the timing based on the TX used.

**Figure 36** shows the AD added when the RX is not on a TX. This indicates normal start-up without requirement of the TX.

**Figure 33. Transition Between Wireless Power and Wired Power (EN1 = EN2 = LOW)**

**Figure 34. Transition Between Wired Power and Wireless Power (EN1 = EN2 = LOW)**

**Figure 35. Wireless Power Start-Up With V<sub>AD</sub> = 5 V (EN1 = EN2 = LOW)**

**Figure 36. AD Power Start-Up With No Transmitter (EN1 = EN2 = LOW)**

## Typical Applications (continued)

### 9.2.3 Wireless and Direct Charging of a Li-Ion Battery at 800 mA

**Figure 37. bq51010B Used as a Wireless Power Supply With Adapter Multiplexing on a Two Input Charger**

#### 9.2.3.1 Design Requirements

The goal of this design is to charge a 3.7-V Li-Ion battery at 800 mA either wirelessly or with a direct USB wired input. This design will use the bq51010B wireless power supply and the bq24161 single-cell Li-Ion battery charger. A low resistance path has to be created between the output of bq51010B and the input of bq24161.

#### 9.2.3.2 Detailed Design Procedure

The basic components used in [Figure 27](#) and [Figure 32](#) are reused in [Figure 37](#), as well. The bq51010B OUT pin is tied to the output of Q1 and directly to the IN pin of the bq24040. No other changes to the bq51010B circuitry are required. Consult the bq24161 data sheet [bq2416xx 2.5A, Dual-Input, Single-Cell Switched-Mode Li-Ion Battery Charger with Power Path Management and I<sup>2</sup>C Interface](#) for selecting its correct components.

## 10 Power Supply Recommendations

The bq51010B requires a Qi-compatible transmitter as its power source.

## 11 Layout

### 11.1 Layout Guidelines

- Keep the trace resistance as low as possible on AC1, AC2, and BAT.
  - Detection and resonant capacitors must be as close to the device as possible.
  - COMM, CLAMP, and BOOT capacitors must be placed as close to the device as possible.
  - Via interconnect on PGND net is critical for appropriate signal integrity and proper thermal performance.
  - High-frequency bypass capacitors must be placed close to RECT and OUT pins.
  - ILIM and FOD resistors are important signal paths and the loops in those paths to PGND must be minimized.
- Signal and sensing traces are the most sensitive to noise; the sensing signal amplitudes are usually measured in mV, which is comparable to the noise amplitude. Make sure that these traces are not being interfered by the noisy and power traces. AC1, AC2, BOOT1, BOOT2, COMM1, and COMM2 are the main source of noise in the board. These traces must be shielded from other components in the board. It is usually preferred to have a ground copper area placed underneath these traces to provide additional shielding. Also, make sure they do not interfere with the signal and sensing traces. The PCB must have a ground plane (return) connected directly to the return of all components through vias (two vias per capacitor for power-stage capacitors, one via per capacitor for small-signal components).

For a 1-A fast charge current application, the current rating for each net is as follows:

- AC1 = AC2 = 1.2 A
- OUT = 1 A
- RECT = 100 mA (RMS)
- COMMx = 300 mA
- CLAMPx = 500 mA
- All others can be rated for 10 mA or less

### 11.2 Layout Example

#### 12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 12.5 Trademarks

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 12.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 12.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ51010BYFPR	ACTIVE	DSBGA	YFP	28	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ51010B	<a href="#">Samples</a>
BQ51010BYFPT	NRND	DSBGA	YFP	28	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ51010B	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
