

LMH664x 2.7 V, 650 μ A, 55 MHz, Rail-to-Rail Input and Output Amplifiers with Shutdown Option

1 Features

- ($V_S = 2.7V$, $T_A = 25^\circ C$, $R_L = 1k\Omega$ to $V^+/2$, $A_V = +1$. Typical Values Unless Specified.
- -3dB BW 55 MHz
- Supply Voltage Range 2.5 V to 12 V
- Slew Rate 22 V/ μ s
- Supply Current 650 μ A/channel
- Output Short Circuit Current 42 mA
- Linear Output Current ± 20 mA
- Input Common Mode Voltage 0.3 V Beyond Rails
- Output Voltage Swing 20 mV from Rails
- Input Voltage Noise 17 nV/ \sqrt{Hz}
- Input Current Noise 0.75 pA/ \sqrt{Hz}

2 Applications

- Active Filters
- High Speed Portable Devices
- Multiplexing Applications (LMH6647)
- Current Sense Buffer
- High Speed Transducer Amp

3 Description

The LMH6645 (single) and LMH6646 (dual), rail-to-rail input and output voltage feedback amplifiers, offer high speed (55 MHz), and low voltage operation (2.7 V) in addition to micro-power shutdown capability (LMH6647, single).

Input common mode voltage range exceeds either supply by 0.3 V, enhancing ease of use in multitude of applications where previously only inferior devices could be used. Output voltage range extends to within 20 mV of either supply rails, allowing wide dynamic range especially in low voltage applications. Even with low supply current of 650 μ A/amplifier, output current capability is kept at a respectable ± 20 mA for driving heavier loads. Important device parameters such as BW, Slew Rate and output current are kept relatively independent of the operating supply voltage by a combination of process enhancements and design architecture.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMH6645	SOT-23 (5)	2.90 mm x 1.60 mm
	SOIC (8)	4.90 mm x 3.91 mm
LMH6646	SOIC (8)	4.90 mm x 3.91 mm
	VSSOP (8)	3.00 mm x 3.00 mm
LMH6647	SOT-23 (6)	2.92 mm x 1.60 mm
	SOIC (8)	4.90 mm x 3.91 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

5 Description (continued)

In portable applications, the LMH6647 provides shutdown capability while keeping the turn-off current to less than 50 μ A. Both turn-on and turn-off characteristics are well behaved with minimal output fluctuations during transitions. This allows the part to be used in power saving mode, as well as multiplexing applications. Miniature packages (SOT-23, VSSOP-8, and SOIC-8) are further means to ease the adoption of these low power high speed devices in applications where board area is at a premium.

6 Pin Configuration and Functions

Pin Functions

NAME	PIN					I/O	DESCRIPTION

7 Specifications

7.1 Absolute Maximum Ratings ⁽¹⁾⁽²⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Output short circuit duration		See ⁽³⁾ and ⁽⁴⁾		
V_{IN} differential		±2.5		V
Voltage at input/output pins		V^+ +0.8, V^- -0.8		V
Supply voltage ($V^+ - V^-$)		12.6		V
Junction temperature ⁽⁵⁾		+150		°C
Soldering Information	Infrared or Convection (20 sec)	235		
	Wave Soldering (10 sec)	260		

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
- (2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (3) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C.
- (4) Output short circuit duration is infinite for $V_S < 6$ V at room temperature and below. For $V_S > 6$ V, allowable short circuit duration is 1.5 ms.
- (5) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$. All numbers apply for packages soldered directly onto a PC board.

7.2 Handling Ratings

			MIN	MAX	UNIT
T_{stg}	Storage temperature range		-65	+150	°C
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	2000		V
		Machine model (MM) ⁽²⁾	200		

- (1) JEDEC document JEP155 states that 2000-V HBM allows safe manufacturing with a standard ESD control process. Human body model, 1.5 k Ω in series with 100pF.
- (2) JEDEC document JEP157 states that 200-V MM allows safe manufacturing with a standard ESD control process. Machine model, 0 Ω in series with 200 pF.

7.3 Recommended Operating Conditions⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply Voltage ($V^+ - V^-$)		2.5	12	V
Temperature Range ⁽²⁾		-40	+85	°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
- (2) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$. All numbers apply for packages soldered directly onto a PC board.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾	LMH6645		LMH6646		LMH6647		UNIT
	SOT-23		SOIC-8	VSSOP-8	SOT-23	SOIC-8	
	5 PINS	8 PINS	8 PINS	8 PINS	6 PINS	8 PINS	
$R_{\theta JA}$ Junction-to-ambient thermal resistance	265	190	190	235	265	190	°C/W

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](http://www.ti.com/lit/zip/SRA953).

7.5 Electrical Characteristics 2.7 V

Unless otherwise specified, all limits ensured for at $T_J = 25^\circ\text{C}$, $V^+ = 2.7\text{V}$, $V^- = 0\text{V}$, $V_{\text{CM}} = V_O = V^+/2$, and $R_f = 2\text{k}\Omega$, and $R_L = 1\text{k}\Omega$ to $V^+/2$.

PARAMETER		TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
BW	-3dB BW	$A_V = +1$, $V_{\text{OUT}} = 200\text{ mV}_{\text{PP}}$, $V_{\text{CM}} = 0.7\text{ V}$	40	55		MHz

R_{IN}	Common mode input resistance			3		$\text{M}\Omega$
C_{IN}	Common mode input capacitance			2		pF
CMVR	Input common-mode voltage range	CMRR $\geq 50\text{dB}$		-0.5	-0.3	V
			$-40^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$		-0.1	
				3.0	3.2	
CMRR	Common mode rejection ratio	V_{CM} Stepped from 0 V to 2.7 V	46	77		dB
		V_{CM} Stepped from 0 V to 1.55 V	58	76		
A_{VOL}	Large signal voltage gain	$V_O = 0.35\text{ V}$ to 2.35 V	76	87		dB
		$-40^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$	74			
V_O	Output swing high	$R_L = 1\text{k}$ to $V^+/2$	2.55	2.66		V
		$R_L = 10\text{k}$ to $V^+/2$		2.68		
	Output swing low	$R_L = 1\text{k}$ to $V^+/2$		40	150	mV
		$R_L = 10\text{k}$ to $V^+/2$		20		

(1) All limits are ensured by testing or statistical analysis.

(2) Typical values represent the most likely parametric norm.

(3) Slew rate is the average of the rising and falling slew rates.

(4) ensured based on characterization only.

(5) Positive current corresponds to current flowing into the device.

(6) Offset voltage average drift determined by dividing the change in V_{OS} at temperature extremes into the total temperature change.

Electrical Characteristics 2.7 V (continued)

Unless otherwise specified, all limits ensured for at $T_J = 25^\circ\text{C}$, $V^+ = 2.7\text{V}$, $V^- = 0\text{V}$, $V_{\text{CM}} = V_O = V^+/2$, and $R_f = 2\text{k}\Omega$, and $R_L = 1\text{k}\Omega$ to $V^+/2$.

PARAMETER		TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
I_{SC}	Output short circuit current	Sourcing to V^- $V_{\text{ID}} = 200\text{mV}$ ⁽⁷⁾⁽⁸⁾		43		mA
		Sinking to V^+ $V_{\text{ID}} = -200\text{mV}$ ⁽⁷⁾⁽⁸⁾		42		
I_{OUT}	Output current	$V_{\text{OUT}} = 0.5\text{V}$ from rails		± 20		mA
PSRR	Power supply rejection ratio	$V^+ = 2.7\text{V}$ to 3.7V or $V^- = 0\text{V}$ to -1V	75	83		dB
I_{S}	Supply current (per channel)	Normal Operation		650	1250	μA
		Shutdown Mode (LMH6647 only)		15	50	

(7) Short circuit test is a momentary test.

(8) Output short circuit duration is infinite for $V_{\text{S}} < 6\text{V}$ at room temperature and below. For $V_{\text{S}} > 6\text{V}$, allowable short circuit duration is 1.5ms.

7.6 Electrical Characteristics 5V

Unless otherwise specified, all limits ensured for at $T_J = 25^\circ\text{C}$, $V^+ = 5\text{V}$, $V^- = 0\text{V}$, $V_{\text{CM}} = V_O = V^+/2$, and $R_f = 2\text{k}\Omega$, and $R_L = 1\text{k}\Omega$ to $V^+/2$.

8 Detailed Description

8.1 Overview

The LMH664x family is based on proprietary VIP10 dielectrically isolated bipolar process.

This device family architecture features the following:

- Complimentary bipolar devices with exceptionally high f_t (~8 GHz) even under low supply voltage (2.7 V) and low Collector bias current.
- Rail-to-Rail input which allows the input common mode voltage to go beyond either rail by about 0.5 V typically.
- A class A-B “turn-around” stage with improved noise, offset, and reduced power dissipation compared to similar speed devices (patent pending).
- Common Emitter push-pull output stage capable of 20 mA output current (at 0.5 V from the supply rails) while consuming only ~700 μA of total supply current per channel. This architecture allows output to reach within mV of either supply rail at light loads.
- Consistent performance from any supply voltage (2.7 V to 10 V) with little variation with supply voltage for the most important specifications (BW, SR, I_{OUT} , for example)

8.2 Functional Block Diagram

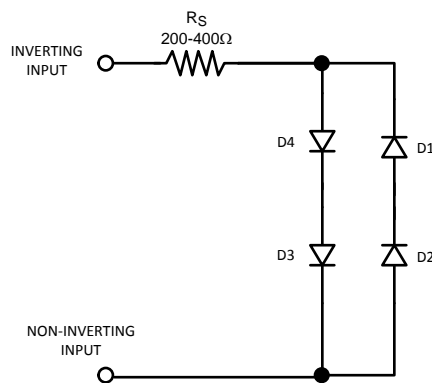

Figure 42. LMH6647 Equivalent Input in Shutdown Mode

During shutdown, the input stage has an equivalent circuit as shown below in [Figure 42](#).

8.3 Feature Description

8.3.1 LMH6647 Micro-power Shutdown

To keep the output at or near ground during shutdown when there is no other device to hold the output low, a switch (transistor) could be used to shunt the output to ground. Figure 43 shows a circuit where a NPN bipolar is used to keep the output near ground (~ 80 mV):

Figure 43. Active Pull-Down Schematic

Figure 44 shows the output waveform.

Figure 44. Output Held Low by Active Pull-Down Circuit

NOTE

For normal operation, tie the SD pin to V^- .

If bipolar transistor power dissipation is not tolerable, the switch could be by a N-channel enhancement mode MOSFET.

8.4 Device Functional Modes

The LMH6647 can be shutdown to save power and reduce its supply current to less than 50 μA ensured, by applying a voltage to the SD pin. The SD pin is “active high” and needs to be tied to V^- for normal operation. This input is low current ($< 20 \mu\text{A}$, 4 pF equivalent capacitance) and a resistor to V^- ($\leq 20 \text{k}\Omega$) will result in normal operation. Shutdown is ensured when SD pin is 0.4V or less from V^+ at any operating supply voltage and temperature.

In the shutdown mode, essentially all internal device biasing is turned off in order to minimize supply current flow and the output goes into Hi-Z (high impedance) mode. Complete device Turn-on and Turn-off times vary considerably relative to the output loading conditions, output voltage, and input impedance, but is generally limited to less than 1 μs (see tables for actual data).

As seen in [Figure 42](#) in shutdown, there may be current flow through the internal diodes shown, caused by input potential, if present. This current may flow through the external feedback resistor and result in an apparent output signal. In most shutdown applications the presence of this output is inconsequential. However, if the output is “forced” by another device such as in a multiplexer, the other device will need to conduct the current described in order to maintain the output potential.

The total input common mode voltage range, which extends from below V^- to beyond V^+ , is covered by both an NPN and a PNP stage. The NPN stage is switched on whenever the input is less than 1.2 V from V^+ and the PNP stage covers the rest of the range. In terms of the input voltage, there is an overlapping region where both stages are processing the input signal. This region is about 0.5 V from beginning to the end. As far as the device application is concerned, this transition is a transparent operation. However, keep in mind that the input bias current value and direction will depend on which input stage is operating (see [Figure 29](#)). For low distortion applications, it is best to keep the input common mode voltage from crossing this transition point. Low gain settling applications, which generally encounter larger peak-to-peak input voltages, could be configured as inverting stages to eliminate common mode voltage fluctuations.

In terms of the output, when the output swing approaches either supply rail, the output transistor will enter a quasi-saturated state. A subtle effect of this operational region is that there is an increase in supply current in this state (up to 1 mA). The onset of Quasi-saturation region is a function of output loading (current) and varies from 100 mV at no load to about 1 V when output is delivering 20 mA, as measured from supplies. Both input common mode voltage and output voltage level affect the supply current (see [Figure 32](#)).

With 2.7V supplies and a common mode input voltage range that extends beyond either supply rail, the LMH664x family is well suited to many low voltage/low power applications. Even with 2.7 V supplies, the -3dB BW (@ $A_v = +1$) is typically 55 MHz with a tested limit of 45 MHz. Production testing guarantees that process variations will not compromise speed.

This device family is designed to avoid output phase reversal. With input over-drive, the output is kept near the supply rail (or as close to it as mandated by the closed loop gain setting and the input voltage). [Figure 45](#), below, shows the input and output voltage when the input voltage significantly exceeds the supply voltages.

The output does not exhibit any phase reversal as some op amps do. However, if the input voltage range is exceeded by more than a diode drop beyond either rail, the internal ESD protection diodes will start to conduct. The current flow in these ESD diodes should be externally limited.

Device Functional Modes (continued)

Figure 45 demonstrates that the output is well behaved and there are no spikes or glitches due to the switching. Switching times are approximately around 500 ns based on the time when the output is considered “valid”.

Figure 45. Input/Output Shown with Exceeded Input CMVR

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The LMH664x family is well suited to many low voltage/low power applications and is designed to avoid output phase reversal. [Figure 45](#), for example, depicts the Input/Output Shown with Exceeded Input CMVR and functions as a 2:1 MUX operating on a single 2.7-V power supply by utilizing the shutdown feature of the LMH6647.

9.2 Typical Application

Figure 46. 2:1 MUX Operating off a 2.7V Single Supply

9.2.1 Design Requirements

This application requires fast, glitch-less transition between selected channels. The LMH6647 turn on and turn off times are 250 ns and 560 ns respectively. Transition between channels is devoid of any excessive glitches.

9.2.2 Detailed Design Procedure

In this application, the LMH6647 output pins are directly tied to each other. The shutdown pin of each LMH6647 is driven in-opposite sense of the other (that is, “Low” on 1st LMH6647 with “High” on the 2nd LMH6647, and vice versa). When shutdown is invoked, the device output enters Hi-Z state, while the alternate LMH6647 is being powered on simultaneously. This way, the shutdown function serves the dual purpose of allowing only the input associated with device which is not in shutdown to be selected and to appear at the output.

Typical Application (continued)

9.2.3 Application Curve

Figure 47 shows the MUX output when selecting between a 1 MHz sine and a 250 KHz triangular waveform.

Figure 47. 2:1 MUX Output

10 Power Supply Recommendations

The LMH664x device family can operate off a single supply or with dual supplies. The input CM capability of the parts (CMVR) extends covers the entire supply voltage range for maximum flexibility. Supplies should be decoupled with low inductance, often ceramic, capacitors to ground less than 0.5 inches from the device pins. The use of ground plane is recommended, and as in most high speed devices, it is advisable to remove ground plane close to device sensitive pins such as the inputs.

11 Layout

11.1 Layout Guidelines

Generally, a good high-frequency layout will keep power supply and ground traces away from the inverting input and output pins. Parasitic capacitances on these nodes to ground will cause frequency response peaking and possible circuit oscillations. For more information, see Application Note OA-15, *Frequent Faux Pas in Applying Wideband Current Feedback Amplifiers* ([SNOA367](#)).

Another important parameter in working with high speed/high performance amplifiers is the component values selection. Choosing large valued external resistors will affect the closed loop behavior of the stage because of the interaction of these resistors with parasitic capacitances. These capacitors could be inherent to the device or a by-product of the board layout and component placement. Either way, keeping the resistor values lower will diminish this interaction. On the other hand, choosing very low value resistors could load down nodes and will contribute to higher overall power dissipation.

11.2 Layout Example

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
