

## LMH0318 3 Gbps HD/SD SDI Reclocker with Integrated Cable Driver

### 1 Features

- Supports ST 424(3G), 292(HD), 259(SD), MADI, and DVB-ASI
- Locks to rates 2.97 Gbps, 1.485 Gbps, or Divided by 1.001 sub-rates, and DVB-ASI
- Reference-free Operation with Fast Lock Time covering all Supported or Selected Data Rates
- 75  $\Omega$  and 100  $\Omega$  Transmitter Outputs
- Integrated 2:1 Mux Input, 1:2 Demux/Fanout Outputs
- Automatic Slew Rate Based on Input Rate Detect
- On-chip Eye Monitor
- Low 300 mW Power Consumption With Automatic Power Down On Loss Of Input Signal
- Programmable via SPI, Or SMBus Interface
- Single 2.5 V Supply Operation
- Small 4 mm  $\times$  4 mm 24-pin QFN Package
- -40°C to +85°C Operating Temperature Range
- Footprint compatible with LMH1218 for easy upgrade to 12G

### 2 Applications

- SMPTE Compatible Serial Digital Interface (SDI)
- Broadcast Video Routers, Switches, and Monitors
- Digital Video Processing and Editing
- DVB-ASI and Distribution Amplifiers

### 3 Description

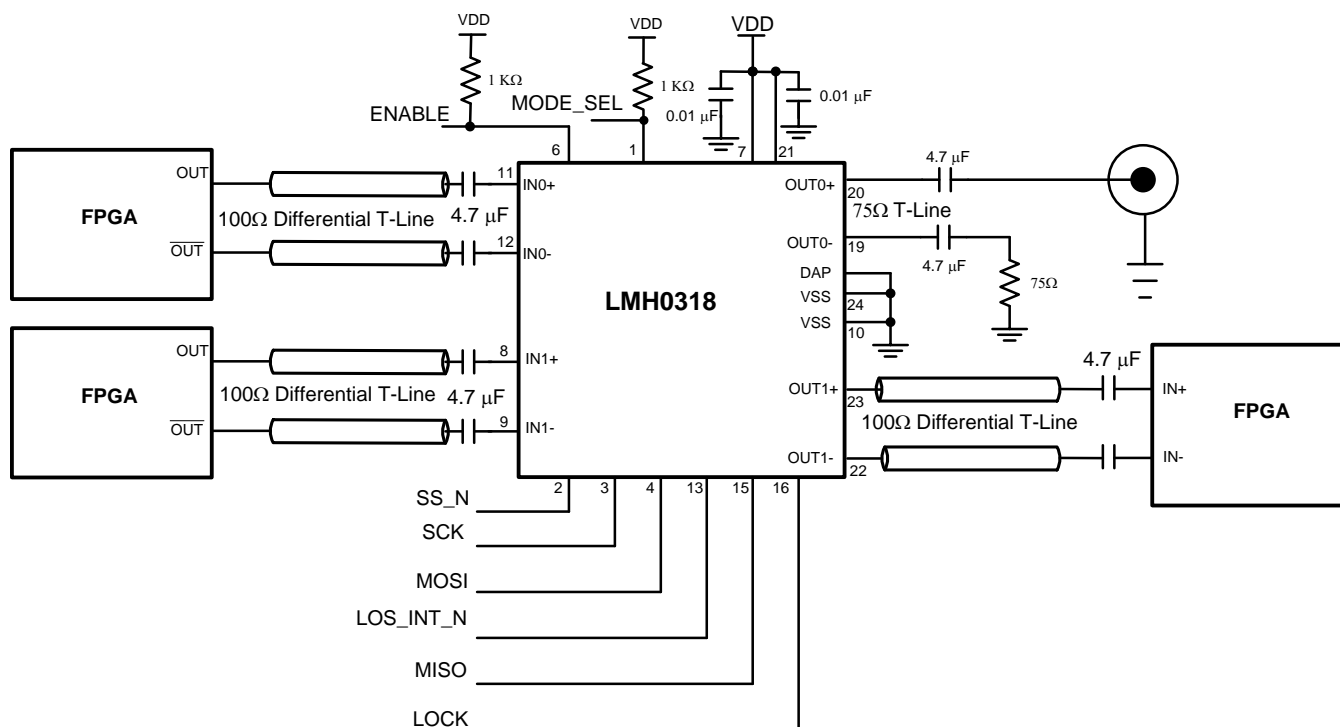

The LMH0318 is a 3 Gbps HD/SD SDI Reclocker with Integrated Cable Driver designed to drive serial video data compatible to SMPTE-SDI and DVB-ASI standards. The clock and data recovery circuit eliminates accumulated jitter and detects the incoming data rate without requiring an external reference clock. The integrated driver with 75 ohm and 50 ohm outputs enables multiple media options such as coax and FR4 PCB.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMH0318	WQFN (24)	4 mm $\times$ 4 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

#### Simplified SPI Schematic

## 4 Revision History

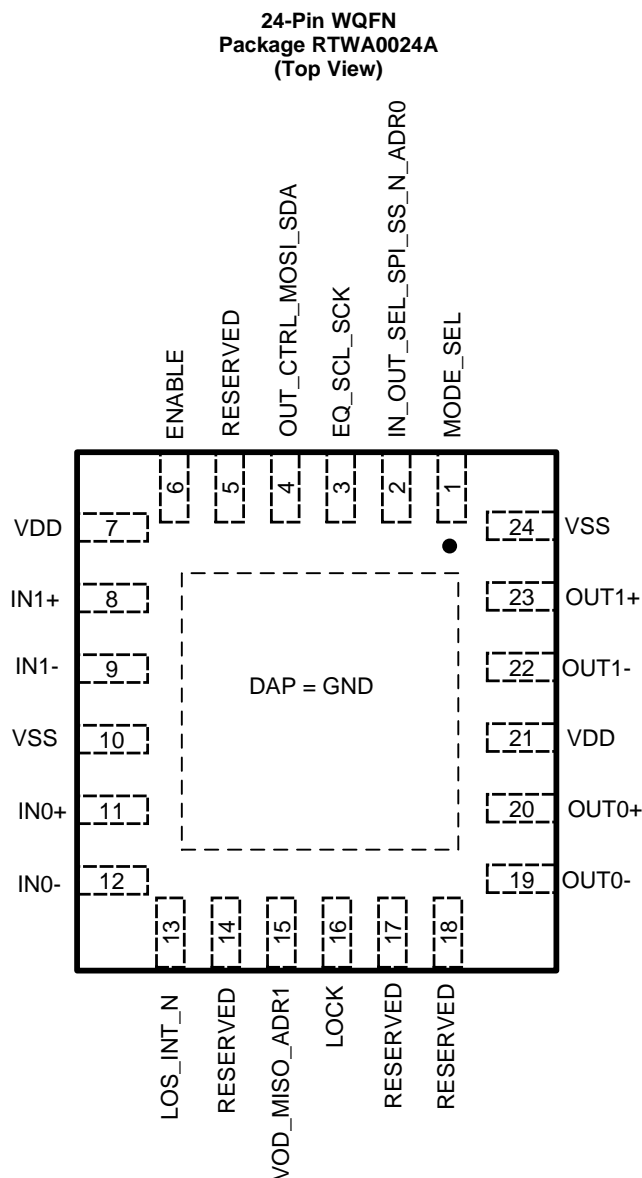

DATE	REVISION	NOTES
September 2015	*	Initial release.

## 5 Description continued

The integrated 2-to-1 MUX on the input of the LMH0318 enables selection between two video sources, while the programmable equalizer compensates for the PC board loss to extend signal reach. With a wide range clock-and-data recovery (CDR) circuit, the on-chip reclocker automatically detects and locks to serial data from 270 Mbps to 2.97 Gbps without the need for an external reference clock and loop filter component, thereby simplifying board design and lowering system cost. The reclocked serial data can be routed to either the 75  $\Omega$  or 50  $\Omega$  transmitter output, or both simultaneously (1-to-2 fanout mode). The output voltage swing is compatible to ST 424, 344, 292, and 259 standards.

A non-disruptive eye monitor allows for real-time measurement of serial data to simplify system startup or field tuning. The LMH0318 is pin compatible with the LMH1218, 12 Gbps Cable Driver with Integrated Reclocker.

## 6 Pin Configuration and Functions

**Pin Descriptions – SPI Mode/ Mode\_SEL = 1 kΩ to VDD**

PIN		I/O	DESCRIPTION
NAME	NO.		
CONTROL/INDICATOR I/O			
MODE_SEL	1	Input, 4-Level	Determines Device Configuration: SPI or SMBus 1 kΩ to VDD: <ul style="list-style-type: none"><li>SPI mode. See <a href="#">Initialization Set Up</a></li></ul>
SS_N	2	Input, 2-Level	SPI Slave Select. . This pin has internal pull up
SCK	3	Input, 2.5V LVCMOS, 2-Level	SPI serial clock input
MOSI	4	Input, 2-Level	SPI Master Output / Slave Input. LMH0318 SPI data receive
RESERVED	5,14,17,18		No Connect
ENABLE	6	Input, 4-Level	Powers down device when pulled low 1 kΩ to VDD: <ul style="list-style-type: none"><li>Power down until valid signal detected</li></ul> Float( <b>Default</b> ): <ul style="list-style-type: none"><li>Reserved</li></ul> 20 kΩ to GND: <ul style="list-style-type: none"><li>Reserved</li></ul> 1 kΩ to GND: <ul style="list-style-type: none"><li>Power down including signal detects and Reset Registers upon power-up</li></ul>
LOS_INT_N	13	Output, LVCMOS Open Drain, 2-Level	Programmable Interrupt caused by change in LOS, violation of internal eye monitor threshold, or change in lock. External 4.7-kΩ pull-up resistor is required. This pin is 3.3 V LVCMOS tolerant.
MISO	15	Output, 2.5 V LVCMOS, 2-Level	SPI Master Input / Slave Output. LMH0318 SPI data transmit
LOCK	16	Output, 2.5V LVCMOS, 2-Level	Indicates CDR lock detect status High: <ul style="list-style-type: none"><li>CDR locked</li></ul> Low: <ul style="list-style-type: none"><li>CDR not locked</li></ul>
HIGH SPEED DIFFERENTIAL I/O			
IN0+	11	Input, Analog	Inverting and non-inverting differential inputs. An on-chip 100 Ω terminating resistor connects IN0+ to IN0-. Inputs require 4.7 μF AC coupling capacitors.
IN0-	12	Input, Analog	
IN1+	8	Input, Analog	Inverting and non-inverting differential inputs. An on-chip 100 Ω terminating resistor connects IN1+ to IN1-. Inputs require 4.7 μF AC coupling capacitors.
IN1-	9	Input, Analog	
OUT0+	20	Output, 75 Ω CML Compatible	Inverting and non-inverting 75 Ω outputs. An on-chip 75 Ω terminating resistor connects OUT0+ and OUT0- to VDD. Outputs require 4.7 μF AC coupling capacitors
OUT0-	19	Output, 75 Ω CML Compatible	
OUT1+	23	Output, Analog	Inverting and non-inverting differential outputs. An on-chip 100 Ω terminating resistor connects OUT1+ to OUT1-. Outputs require 4.7 μF AC coupling capacitors
OUT1-	22	Output, Analog	
POWER			
VDD	7, 21	2.5 V Supply	2.5 V ± 5%
VSS	10, 24	Ground	Connect directly to ground (GND)
DAP		Ground	Exposed DAP, connect to GND using at least 5 vias (see <a href="#">Figure 23</a> )

**Pin Descriptions – SMBUS Mode/ MODE\_SEL = 1 kΩ to GND**

PIN		I/O	DESCRIPTION
NAME	NO.		
MODE_SEL	1	Input, 4-Level	Determines Device Configuration: SPI or SMBus 1 kΩ to GND: SMBus mode. See <a href="#">Initialization Set Up</a>
ADDR0	2	Input, 4-Level	4-level strap pins used to set the SMBus address of the device. The pin state is read on power-up. The multi-level nature of these pins allows for 16 unique device addresses. Note SMBus section for further details. The four strap options include: 1 kΩ to VDD: <ul style="list-style-type: none"> <li>Represents logic state 11'b</li> </ul> Float( <b>Default</b> ): Represents logic state 10'b 7-bits SMBus address = 0x17 20 kΩ to GND: <ul style="list-style-type: none"> <li>Represents logic state 01'b</li> </ul> 1 kΩ to GND: <ul style="list-style-type: none"> <li>Represents logic state 00'b</li> </ul>
ADDR1	15		
SCL	3	Input, 2-Level	SMBus clock input / open drain. External 2-kΩ to 5-kΩ pull-up resistor is required as per SMBus interface standard. This pin is 3.3 V LVCMOS tolerant.
SDA	4	I/O, Open Drain, 2-Level	SMBus data input / open drain. External 2-kΩ to 5-kΩ pull-up resistor is required as per SMBus interface standard. This pin is 3.3 V LVCMOS tolerant.
RESERVED	5,14,17,18		No Connect
ENABLE	6	Input, 4-Level	Powers down device when pulled low 1 kΩ to VDD: <ul style="list-style-type: none"> <li>Power down until valid signal detected</li> </ul> Float( <b>Default</b> ): Reserved 20 kΩ to GND: <ul style="list-style-type: none"> <li>Reserved</li> </ul> 1 kΩ to GND: <ul style="list-style-type: none"> <li>Power down including signal detects and Reset Registers upon power-up</li> </ul>
LOS_INT_N	13	Output, LVCMOS Open Drain, 2-Level	Programmable Interrupt caused by change in LOS, violation of internal eye monitor threshold, change in lock. External 4.7-kΩ pull-up resistor is required. This pin is 3.3 V LVCMOS tolerant.
LOCK	16	Output, 2.5 V LVCMOS, 2-Level	Indicates CDR lock Status High: <ul style="list-style-type: none"> <li>CDR locked</li> </ul> Low: <ul style="list-style-type: none"> <li>CDR not locked</li> </ul>
<b>HIGH SPEED DIFFERENTIAL I/O</b>			
IN0+	11	Input, Analog	Inverting and non-inverting differential inputs. An on-chip 100 Ω terminating resistor connects IN0+ to IN0-. Inputs require 4.7 μF AC coupling capacitors.
IN0-	12	Input, Analog	
IN1+	8	Input, Analog	Inverting and non-inverting differential inputs. An on-chip 100 Ω terminating resistor connects IN0+ to IN0-. Inputs require 4.7 μF AC coupling capacitors.
IN1-	9	Input, Analog	
OUT0+	20	Output, 75 Ω CML Compatible	Inverting and non-inverting 75 Ω outputs. An on-chip 75 Ω terminating resistor connects OUT0+ and OUT0- to VDD. Outputs require 4.7 μF AC coupling capacitors
OUT0-	19	Output, 75 Ω CML Compatible	
OUT1+	23	Output, Analog	Inverting and non-inverting differential outputs. An on-chip 100 Ω terminating resistor connects OUT1+ to OUT1-. Outputs require 4.7 μF AC coupling capacitors
OUT1-	22	Output, Analog	
VDD	7, 21	2.5 V Supply	2.5V ± 5%
VSS	10, 24	Ground	Connect directly to ground (GND)
DAP		Ground	Exposed DAP, connect to GND using at least 5 vias (see <a href="#">Figure 23</a> )

## 7 Specifications

### 7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Supply Voltage (VDD to GND)	-0.5	2.75	V
3.3 V Open drain I/O input/output voltage (SDA, SCL, LOS_INT_N)	-0.5	4.0	V
2.5V LVCMOS Input/Output Voltage	-0.5	2.75	V
High Speed input Voltage	-0.5	2.75	V
High Speed Input Current	-30	30	mA

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. Absolute Maximum Numbers are ensured for a junction temperature range of -40°C to +125°C. Models are validated to Maximum Operating Voltages only.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±4500 V may actually have higher performance.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±1500 V may actually have higher performance.

### 7.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

	MIN	TYP	MAX	UNIT
Supply voltage <sup>(1)</sup>	2.375	2.5	2.625	V
3.3 V Open drain I/O input/output voltage <sup>(1)</sup>	3	3.3	3.6	V
Supply noise, 50 Hz to 10 MHz, sinusoidal		40		mVpp
Ambient Temperature	-40	25	85	°C
Source transmit differential launch amplitude	300	500	1000	mV <sub>P-P</sub>
SMBus clock frequency (SCL) in SMBus slave mode		100	400	kHz
SMBUS SDA and SCL Voltage Level			3.6	V
SPI Clock Frequency		10	20	MHz

- (1) DC plus AC power should not exceed these limits.

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)(2)</sup>		RTWA0024A	UNIT
		24 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	34	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	31.4	
R <sub>θJB</sub>	Junction-to-board thermal resistance	11.8	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.3	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	11.8	
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	2.7	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).  
(2) No heat sink is assumed for these estimations. Depending on the application, a heat sink, faster air flow, and/or reduced ambient temperature (< 85°C) may be required in order to maintain the maximum junction temperature specified in [Electrical Characteristics](#).

## 7.5 Electrical Characteristics

Over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER						
PD	Power dissipation	Locked 75 Ω OUT0 only (800 mVpp), EOM powered down		300		mW
		Locked OUT1 only (600 mVpp, diff), EOM powered down		195		mW
		Transient power during CDR lock acquisition, 75 Ω OUT0 and OUT1 powered up, EOM powered down		400	500	mW
PD_RAW	Power dissipation in force RAW mode (CDR bypass)	EQ bypass, OUT0 720mVpp, OUT1 600mVpp IN0 to OUT0 and OUT1 or IN1 to OUT0 and OUT1		195		mW
		IN0 to OUT0, OUT1 powered down		160		mW
		IN1 to OUT1, OUT0 powered down		80		mW
4-LEVEL INPUT and 2.5 V LVCMOS DC SPECIFICATIONS						
V <sub>IH</sub>	High level input voltage	4-level input (MODE_SEL, ADDR0/1, ENABLE pins)		0.95*VDD		V
V <sub>IF</sub>	Float level input voltage	4-level input (MODE_SEL, ADDR0/1, ENABLE pins)		0.67*VDD		V
V <sub>I20K</sub>	20K to GND input voltage	4-level input (MODE_SEL, ADDR0/1, ENABLE pins)		0.33*VDD		V
V <sub>IL</sub>	Low level input voltage	4-level input (MODE_SEL, ADDR0/1, ENABLE pins)		0.1		V
V <sub>OH</sub>	High level output voltage	IOH = -3 mA	2			V
V <sub>OL</sub>	Low level output voltage	IOL = 3 mA			0.4	V
I <sub>IH</sub>	Input high leakage current	V <sub>input</sub> = VDD SPI Mode: LVCMOS (SPI_SCK, SPI_SS_N) pins			15	μA
		SMBus Mode: LVCMOS (SMB_SDA, SMB_SCL) pins			15	μA
		SMBus Mode: 4-Levels (ADDR0, ADDR1) pins	20	44	80	μA
		4-Levels (MODE_SEL, ENABLE) pins	20	44	80	μA
I <sub>IL</sub>	Input low leakage current	V <sub>input</sub> = GND SPI Mode: LVCMOS (SPI_MOSI, SPI_SCK) pins	-15			μA
		V <sub>input</sub> = GND SPI Mode: LVCMOS (SPI_SS_N) pins	-37			μA
		SMBus Mode: LVCMOS (SMB_SDA, SMB_SCL) pins	-15			μA
		SMBus Mode: 4-Levels (ADDR0, ADDR1) pins	-160	-93	-40	μA
		4-Levels (MODE_SEL, ENABLE) pins	-160	-93	-40	μA

## Electrical Characteristics (continued)

Over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
3.3-V TOLERANT LVCMOS / LVTTTL DC SPECIFICATIONS (SDA, SCL, LOS_INT_N)						
V <sub>IH25</sub>	High level input voltage	2.5 V Supply Voltage	1.75		3.6	V
V <sub>IL</sub>	Low level input voltage		GND		0.8	V
V <sub>OL</sub>	Low level output voltage	IOL = 1.25 mA			0.4	V
I <sub>IH</sub>	Input high current	VIN = 2.5 V, VDD = 2.5 V	20		40	μA
I <sub>IL</sub>	Input low current	VIN = GND, VDD = 2.5 V	-10		10	μA
SIGNAL DETECT						
S <sub>DH</sub>	Signal detect (default) Assert threshold level <sup>(1)(2)</sup>	2.97 Gbps, EQ Pathological Pattern		22		mV <sub>P-P</sub>
		2.97 Gbps, PLL Pathological Pattern		22		mV <sub>P-P</sub>
		2.97 Gbps, PRBS10 Pattern		22		mV <sub>P-P</sub>
S <sub>DL</sub>	Signal detect (default) De-assert threshold level <sup>(1)</sup>	2.97 Gbps EQ Pathological Pattern		16		mV <sub>P-P</sub>
		2.97 Gbps, PLL Pathological Pattern		16		mV <sub>P-P</sub>
		2.97 Gbps, PRBS10 Pattern		9		mV <sub>P-P</sub>
HIGH SPEED RECEIVE RX INPUTS (IN_n+, IN_n-)						
R_RD	DC Input differential resistance		75	100	125	Ω
R <sub>L-RX-SDD</sub>	Input differential return loss <sup>(3)(4)</sup>	Measured with the device powered up. SDD11 10 MHz to 2 GHz		-14		dB
		SDD11 2 GHz to 3 GHz		-6.5		dB
R <sub>L-RX-SCD</sub>	Differential to common mode Input conversion <sup>(3)(4)</sup>	Measure with the device powered up.SCD11, 10 MHz to 3 GHz		-20		dB
HIGH SPEED OUTPUTS (OUT_n+, OUT_n-)						
V <sub>VOD_OUT1</sub>	Output differential voltage <sup>(3)(4)</sup>	Default setting, 8T clock pattern	400	600	700	mV <sub>P-P</sub>
V <sub>VOD_OUT1_DE</sub>	De-emphasis Level	VOD = 600mV, maximum De-Emphasis with 16T clock pattern		-9		dB
V <sub>VOD_OUT1_CLK</sub>	Clock output differential voltage	2.97 GHz, 1.485 GHz, and 270 MHz		560		mV <sub>P-P</sub>
V <sub>VOD_OUT0</sub>	Output single ended voltage at OUT0+ with OUT0- terminated <sup>(5)(3)</sup>	Default setting	720	800	880	mV <sub>P-P</sub>
R <sub>DIFF_OUT1</sub>	DC output differential resistance			100		Ω

- (1) Data with extraordinarily long periods of high-frequency 1010 data, and for long, lossy channels, the signal amplitude at the input to the device may be severely attenuated by the channel and may fall below the signal detect assert and/or de-assert thresholds.
- (2) The voltage noise on the receiver inputs which has an amplitude larger than the signal detect assert threshold may trigger a signal detect assert condition
- (3) These limits are ensured by bench characterization and are not production tested.
- (4) Dependent on board layout. Characterization data was measured with LMH1218EVM evaluation board
- (5) ATE Production tested using DC method. Apply differential DC signal at the input and measure OUT0P amplitude. OUT0N terminated in 75 Ohm.

## Electrical Characteristics (continued)

Over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
R <sub>DIFF_OUT0</sub>	DC output single ended resistance			75		Ω
T <sub>R_F_OUT1</sub>	Output rise/fall time	Full Slew Rate, 20% to 80% using 8T Pattern		45		ps
T <sub>R_F_OUT0</sub>	Output rise/fall time, PRBS15 <sup>(3)(4)</sup>	2.97 Gbps		35	45	ps
		1.485 Gbps		35	45	ps
		270 Mbps	400	900	1500	ps
T <sub>R_F_OUT0_delta</sub>	Output rise/fall time mismatch <sup>(3)(4)</sup>	2.97 Gbps		3	18	ps
		1.485 Gbps		3	18	ps
		270 Mbps		72	500	ps
V <sub>OVR_UDR_SHOOT</sub>	Output overshoot, undershoot <sup>(3)(4)</sup>	3G/HD/SD Measured with 8T pattern		2.4%	<10%	
V <sub>DC_OFFSET</sub>	DC offset	3G/HD/SD		±0.2		V
V <sub>DC_WANDER</sub>	DC wander	3G/HD/SD EQ Pathological		20		mV
R <sub>L_OUT0_S22</sub>	OUT0 single ended 75-Ω return loss <sup>(3)(4)(6)</sup>	S22 5 MHz to 1.485 GHz		< -15		dB
		S22 1.485 GHz to 3 GHz		< -10		dB
R <sub>L_OUT1_SDD22</sub>	OUT1 differential 100-Ω return loss <sup>(4)(7)</sup>	SDD22 10 MHz - 2 GHz		-20		dB
		SDD22 2 GHz - 3 GHz		-17		dB
R <sub>L_OUT1_SCC22</sub>	OUT1 common mode 50-Ω return loss <sup>(4)(7)</sup>	SCC22 10 MHz - 3 GHz		-11		dB
V <sub>VCN_OUT1_NOISE</sub>	AC common mode voltage noise <sup>(4)</sup>	VOD = 0.6 Vpp, DE = 0dB, PRBS31, 2.97 Gbps		8		mV <sub>RMS</sub>
T <sub>RCK_LATENCY</sub>	Latency reclocked	Reclocked Data		1.5 UI +195		ps
T <sub>RAW_LATENCY</sub>	Latency CDR bypass	Raw Data		230		ps
<b>TRANSMIT OUTPUT JITTER SPECIFICATIONS</b>						
A <sub>J_OUT0</sub>	Alignment jitter <sup>(4)</sup>	OUT0, PRBS15, 2.97 Gbps		0.045		UI
T <sub>J_OUT1</sub>	Total jitter (1E-12) <sup>(4)</sup>	OUT1, PRBS15 2.97 Gbps		0.06		UI
R <sub>J_OUT1</sub>	Random jitter (rms)	OUT1, PRBS15, 2.97 Gbps		0.91		pS <sub>RMS</sub>
D <sub>J_OUT1</sub>	Deterministic jitter	OUT1, PRBS15, 2.97 Gbps		6.8		pSp-P

(6) Output return loss is dependent on board design, this is measured with the LMH1218EVM evaluation board

(7) Measure with the device powered up and outputs a clock signal.

## Electrical Characteristics (continued)

Over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>CLOCK DATA RECOVERY</b>						
D <sub>DATA_RATE</sub>		SMPTE 424 <sup>(8)</sup>		2.970 2.967		Gbps
		SMPTE 292 <sup>(8)</sup>		1.485 1.4835		Gbps
		SMPTE 259M <sup>(8)</sup>		270		Mbps
P <sub>PLL_BW</sub>	PLL bandwidth at -3 dB	Measured with 0.2UI S <sub>J</sub> at 2.97 Gbps		5		MHz
		Measured with 0.2UI S <sub>J</sub> at 1.485 Gbps		3		MHz
		Measured with 0.2UI S <sub>J</sub> at 270 Mbps		1		MHz
J <sub>TOL</sub>	Total input jitter tolerance	TJ = D <sub>J</sub> + R <sub>J</sub> + S <sub>J</sub> , D <sub>J</sub> +R <sub>J</sub> = 0.15 UI S <sub>J</sub> /P <sub>J</sub> , low to high upward sweep (10 kHz to 10 MHz)		0.65		UI
T <sub>LOCK</sub>	Lock time <sup>(3)(9)</sup>	From signal detected to the lock asserted, HEO/VEO lock monitor disable, same setting for 2.97G, 1.485G and 270 MHz data rates		<5		ms
T <sub>TEMP_LOCK</sub>	CDR lock with temperature ramp	Temperature Lock Range, 5°C per minute ramp up and down, -40°C to 85°C operating range		125		°C

(8) Data rate tolerance is within ±1000 ppm

(9) The total CDR lock time depends on number of rate settings enabled and application data rate

## 7.6 Recommended SMBus Interface AC Timing Specifications<sup>(1)(2)(3)</sup>

Over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f <sub>SMB</sub>	Bus operating frequency	10	100	400	kHz
t <sub>BUF</sub>	Bus free time between stop and start condition	1.3			μs
t <sub>HD:STA</sub>	Hold time after (repeated) start condition After this period, the first clock is generated	0.6			μs
t <sub>SU:STA</sub>	Repeated start condition setup time	0.6			μs
t <sub>SU:STO</sub>	Stop condition setup time	0.6			μs
t <sub>HD:DAT</sub>	Data hold time	0			ns
t <sub>SU:DAT</sub>	Data setup time	100			ns
t <sub>LOW</sub>	Clock low period	1.3			μs
t <sub>HIGH</sub>	Clock high period	0.6		50	μs
t <sub>F</sub>	SDA fall time read operation			300	ns
t <sub>R</sub>	SDA rise time read operation			300	ns

- (1) SMBus operation is available 20ms after power up  
(2) These specifications support SMBus 2.0 specifications  
(3) These Parameters are not production tested

## 7.7 Serial Parallel Interface (SPI) Bus Interface AC Timing Specifications<sup>(1)(2)(3)</sup>

Over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f <sub>SCK</sub>	SCK frequency		10	20	MHz
T <sub>SCK</sub>	SCK period	50			ns
t <sub>PH</sub>	SCK pulse width high		0.40*T <sub>SCK</sub>		ns

- (1) Typical values are parametric norms at VDD = 2.5 V, TA = 25°C, and recommended operating conditions at the time of product characterization. Typical values are not production tested.  
(2) These specifications support SPI 1.0 specifications.  
(3) These Parameters are not production tested

## 7.8 Typical Characteristics

Typical device characteristics at  $T_A = +25^\circ\text{C}$  and  $V_{DD} = 2.5\text{ V}$ , unless otherwise noted.

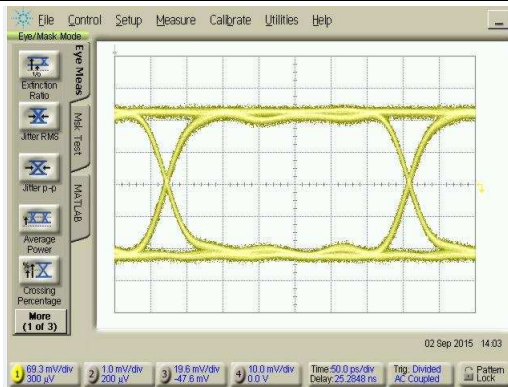

Figure 1. 75  $\Omega$  OUT0 PRBS10 at 2.97 Gbps

Figure 2. 75  $\Omega$  OUT0 PRBS10 at 1.485 Gbps

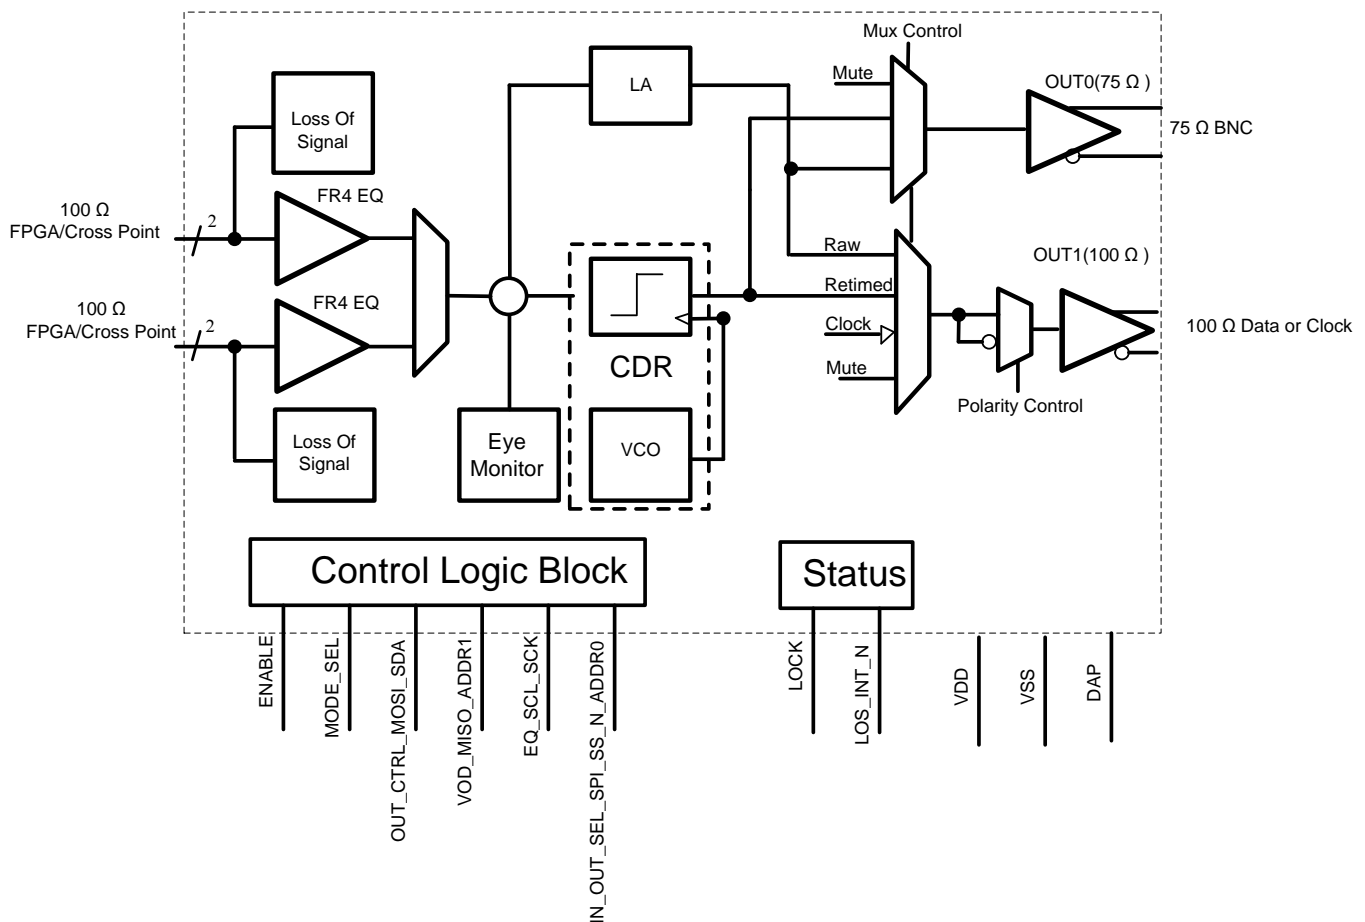

## 8 Detailed Description

### 8.1 Overview

The LMH0318 is a 2.97Gbps/1.485Gbps/0.27Gbps multi-rate serial digital video data reclocker with integrated cable driver intended for equalizing, reclocking, and driving data compatible to the SMPTE standards. It is a 2-input, 2-output single-core chip, enabling 1:2 fan-out or 2:1 MUX operations. Each input has a 100  $\Omega$  continuous time linear equalizer (CTLE) at the front-end, intended to compensate for loss over STP coax or FR-4 PCB trace. The LMH0318 OUT0 is a 75  $\Omega$  cable driver compatible to the SMPTE requirements.

The referenceless Clock-and-Data Recovery (CDR) circuit selects between the two inputs based on user choice. The reclocked output can be driven to one or two outputs. One of the outputs supports 100- $\Omega$  differential cable connection, while the other output can drive a 75  $\Omega$  SMPTE specified cable while meeting transmitter requirements as specified in SMPTE standard. The LMH0318 locks to all required SDI data rates, including 270Mbps, 1.485 Gbps, 1.4835 Gbps, 2.97 Gbps, and 2.967 Gbps. The LMH0318 is assembled in a 4 mm x 4 mm 24-pin QFN package. The chip can be programmed using SPI or SMBus interface.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

The LMH0318 data path consists of several key blocks as shown in the [Functional Block Diagram](#). These key circuits are:

- Loss of Signal Detector
- Continuous Time Linear Equalizer (CTLE) for FR4 Compensation
- 2:1 Multiplexer/1:2 Fanout
- CDR
- Eye Monitor
- Differential Output Selection
- 75  $\Omega$  and 100  $\Omega$  Output Drivers
- SMBus/SPI Configuration

#### 8.3.1 Loss of Signal Detector

The LMH0318 supports two high speed differential input ports, with internal 100  $\Omega$  terminations. The inputs must be AC coupled. The external AC coupling capacitor value should take into account the pathological low frequency content. For most applications, the RC time constant of 4.7  $\mu$ F AC coupling capacitor plus the 50  $\Omega$  termination resistor is capable of handling the pathological video pattern's low frequency content.

The signal detect circuit is designed to assert when data traffic with a certain minimum amplitude is present at the input of the device. It is also designed to de-assert, or remain de-asserted, when there is noise below certain amplitude at the input to the device.

The LMH0318 has two signal detect circuits, one for each input. Each signal detect threshold can be set independently. By default, both signal detects are powered on. The user selects IN1 or IN0 through SMBus/SPI interface.

#### 8.3.2 Continuous Time Linear Equalizer (CTLE)

The LMH0318 has receive-side equalization, and a key part is the Continuous Time Linear Equalizer (CTLE). This circuit operates on the received differential signal and compensates for frequency-dependent loss due to the transmission media. The CTLE applies gain to the input signal. This gain varies over frequency: higher frequencies are boosted more than lower frequencies. The CTLE works to restore the input signal to full amplitude across a wide range of frequencies.

The CTLE consists of 4 stages with each stage having two boost control bits. This allows 256 different boost settings. CTLE boost levels are determined by summing the boost levels of the 4 stages. The CTLE is configured manually. See *LMH0318 Programming Guide* ([SNLU183](#)) on how to quickly select the most appropriate CTLE boost setting.

There are two CTLEs, one for each input, IN0 and IN1. Only one CTLE is enabled at a time, according to the user input channel selection. If IN0 is selected, the CTLE for IN0 is powered on and the IN1 CTLE is powered off. The CTLE is able to handle low loss channels without over-equalizing by bypassing the CTLE.

## Feature Description (continued)

### 8.3.3 2:1 Multiplexer

A 2:1 input multiplexor connects IN0 and IN1 to the CDR. By default, IN0 is selected. To select IN1, the 2:1 multiplexer must be set. See *LMH0318 Programming Guide* ([SNLU183](#)) for detailed settings.

### 8.3.4 Clock and Data Recovery

By default, the equalized data is fed into the CDR for clock and data recovery. The CDR consists of a reference-less Phase Frequency Detector (PFD), Charge Pump (CP), Voltage Controlled Oscillator (VCO), and Output Data Multiplexer (Mux).

The inputs to the Phase and Frequency Detector (PFD) are the data after the CTLE as well as I and Q clocks from the VCO. The LMH0318 will attempt to lock to the incoming data by tuning the VCO to phase-lock to the incoming data rate.

The supported data rates are listed in the following table. See *LMH0318 Programming Guide* ([SNLU183](#)) for further information on configuring the LMH0318 for different data rates.

**Table 1. Supported Data Rates**

DATA RATE RANGE	CDR MODE	COMMENT
2.97 Gbps, 2.967 Gbps	Enabled	
1.485 Gbps, 1.4835 Gbps	Enabled	
270 Mbps	Enabled	
125 Mbps	Disabled	At 125 Mbps device is in CDR bypass

### 8.3.5 Eye Opening Monitor (EOM)

The LMH0318 has an on-chip eye opening monitor (EOM) which can be used to analyze, monitor, and diagnose the performance of the link. The EOM operates on the post-equalized waveform, just prior to the data sampler. Therefore, it captures the effects of all the equalization circuits within the receiver before the data is reclocked. The EOM is operational for 1.485 Gbps and higher data rates.

The EOM monitors the post-equalized waveform in a time window that spans one unit interval and a configurable voltage range that spans up to  $\pm 400$  mV differential. The time window and voltage range are divided into 64 steps, so the result of the eye capture is a  $64 \times 64$  matrix of "hits," where each point represents a specific voltage and phase offset relative to the main data sampler. The number of "hits" registered at each point needs to be taken in context with the total number of bits observed at that voltage and phase offset in order to determine the corresponding probability for that point. The number of bits observed at each point is configurable.

A common measurement performed by the EOM is the horizontal and vertical eye opening. The horizontal eye opening (HEO) represents the width of the post-equalized eye at 0 V differential amplitude, measured in unit intervals or picoseconds. The vertical eye opening (VEO) represents the height of the post-equalized eye, measured midway between the mean zero crossing of the eye. This position in time approximates the CDR sampling phase.

The resulting  $64 \times 64$  matrix produced by the EOM can be processed by software and visualized in a number of ways. Two common ways to visualize this data are shown in [Figure 20](#) and [Figure 21](#). These diagrams depict examples of an eye monitor plot implemented by software. The first plot is an example of using the EOM data to plot a basic eye using ASCII characters, which can be useful for simple diagnostics software. The second plot shows the first derivative of the EOM data, revealing the density of hits and the actual waveforms and crossing that comprise the eye.

### 8.3.6 Fast EOM

Fast EOM is a mechanism that provides an option to read out EOM through SPI/SMBus interfaces by reading the hits observed for each point of 64 × 64 points matrix. Since SPI interface operates at faster clock rate than SMBus interface, the SPI master will have to wait until the EOM start bit, reg 0x24[0], goes low. This indicates EOM samples are available and the SPI master can proceed to read register 0x25 and 0x26. See [SPI Fast EOM Operation](#) and *LMH0318 Programming Guide (SNLU183)* for further details of Fast EOM operation.

#### 8.3.6.1 SMBus Fast EOM Operation

In SMBus mode, the read on register 0x26 acts as an automatic trigger to read the next EOM count value:

1. Enable EOM (power it on), and set VRANGE=0. Write reg 0x24[7] to 1 to turn on fast EOM
2. Read register 0x25 as burst of 2 bytes (EOM hit count) and discard
3. Read register 0x25 as burst of 2 bytes (EOM hit count) and discard
4. Read register 0x25 as burst of 2 bytes (EOM hit count) and save
5. Perform Step 4 4095 times (64 × 64 cells)

#### 8.3.6.2 SPI Fast EOM Operation

To perform EOM calculation over SPI:

1. Enable EOM (power it on), and set VRANGE=0. Write reg 0x24[7] to 1 to turn on fast EOM
2. Read reg 0x26 to initialize. Discard read data
3. Read Reg 0x24[0] which is EOM start bit. Wait for this bit to go low
4. Read register 0x26 EOM hit count and discard. Read on register 0x26 will automatically trigger the next Fast Eye calculation
5. Read Reg 0x24[0]. Wait for this bit to go low
6. Do burst read on register 0x25 and 0x26 to get the EOM hit count value.
7. Repeat Steps 5 and 6 4095 times (64 × 64 cells)

### 8.3.7 LMH0318 Device Configuration

The control pins can be used to configure different operations depending on the functional modes as described in [Table 2](#).

**Table 2. Control Pins**

PIN #	PIN NAME	FUNCTIONAL MODES	
		SPI	SMBus_Slave
1	MODE_SEL	1 kΩ to VDD	1 kΩ to GND
2	IN_OUT_SEL_SPI_SS_N_ADDR0	SPI_SS_N	ADDR0
3	EQ_SCL_SCK	SPI_SCK	SMBUS_SCL
4	OUT_CTRL_MOSI_SDA	SPI_MOSI	SMBUS_SDA
6	ENABLE	ENABLE	ENABLE
13	LOS_INT_N	LOS_INT_N	LOS_INT_N
15	VOD_MISO_ADDR1	SPI_MISO	ADDR1
16	LOCK	LOCK	LOCK

### 8.3.7.1 **MODE\_SEL**

This pin can be configured in 4 possible ways:

1. 1 k $\Omega$  to VDD: This puts the part in SPI mode
2. Float (Default): Reserved
3. 20 k $\Omega$  to GND: Reserved
4. 1 k $\Omega$  to GND: This puts the part in SMBus mode

### 8.3.7.2 **ENABLE**

Normal operation when ENABLE is pulled high, and powers down the device when pulled low.

**Table 3. ENABLE Selection**

ENABLE	POWER CONDITION
1 k $\Omega$ to GND	Power down device (signal detectors powered down, registers at reset state)
20 k $\Omega$ to GND	Reserved
Float	Reserved
1 k $\Omega$ to VDD	Normal Operation

### 8.3.7.3 **LOS\_INT\_N**

LOS\_INT\_N pin is an open drain output. When the channel that has been selected cannot detect a signal at the high-speed input pins (as defined by the assert levels), the pin pulls low. Pin 13 can be configured through share register 0xFF[5] for interrupt functionality.

In SMBus/SPI mode, this pin can be configured as an interrupt. This pin is asserted low when there is an interrupt and goes back high when the interrupt status register is read. There are 7 separate masks for different interrupt sources. These interrupt sources are:

1. If there is a LOS transition on IN0, irrespective of the input channel selected (2 separate masks).
2. If there is a LOS transition on IN1, irrespective of the input channel selected (2 separate masks).
3. HEO or VEO goes below a certain threshold as specified in the registers (1 mask).
4. Lock transition, whether it is asserted or de-asserted – disabled by default (2 mask).

### 8.3.7.4 **LOCK**

Indicates the lock status of the CDR. When CDR is locked this pin is asserted high.

### 8.3.7.5 SMBus MODE

The SMBus interface can also be used to control the device. If pin 1 (MODE\_SEL) is pulled low through 1 kΩ to GND, then Pins 3, 4 are configured as the SMBUS\_SCL and SMBUS\_SDA respectively. Pins 2, 15 are address straps, **ADDR0/ADDR1** respectively, during power up.

The maximum operating speed supported on the SMBus pins is 400 kHz.

**Table 4. SMBus MODE**

ADDR0	ADDR1	ADDR0 [BINARY]	ADDR1 [BINARY]	7-Bit SLAVE ADDRESS [HEX]	8-Bit WRITE COMMAND [HEX]
1 kΩ to GND	1 kΩ to GND	00	00	0D	1A
1 kΩ to GND	20 kΩ to GND	00	01	0E	1C
1 kΩ to GND	Float	00	10	0F	1E
1 kΩ to GND	1 kΩ to VDD	00	11	10	20
20 kΩ to GND	1 kΩ to GND	01	00	11	22
20 kΩ to GND	20 kΩ to GND	01	01	12	24
20 kΩ to GND	Float	01	10	13	26
20 kΩ to GND	1 kΩ to VDD	01	11	14	28
Float	1 kΩ to GND	10	00	15	2A
Float	20 kΩ to GND	10	01	16	2C
Float	Float	10	10	17	2E
Float	1 kΩ to VDD	10	11	18	30
1 kΩ to VDD	1 kΩ to GND	11	00	19	32
1 kΩ to VDD	20 kΩ to GND	11	01	1A	34
1 kΩ to VDD	Float	11	10	1B	36
1 kΩ to VDD	1 kΩ to VDD	11	11	1C	38

**Note:** These are 7 bit addresses. Therefore, the LSB must be added to indicate read/write. LSB equal to zero indicates write and 1 indicates SMBus read operation. For example, for 7 bit hex address 0x0D, the I2C hex address byte is 0x1A to write and 0x1B to read.

### 8.3.7.6 SMBus READ/WRITE Transaction

The System Management Bus (SMBus) is a two-wire serial interface through which various system component chips can communicate with the master. Slave devices are identified by having a unique device address. The two-wire serial interface consists of SCL and SDA signals. SCL is a clock output from the Master to all of the Slave devices on the bus. SDA is a bidirectional data signal between the Master and Slave devices. The LMH0318 SMBUS SCL and SDA signals are open drain and require external pull up resistors.

#### Start and Stop:

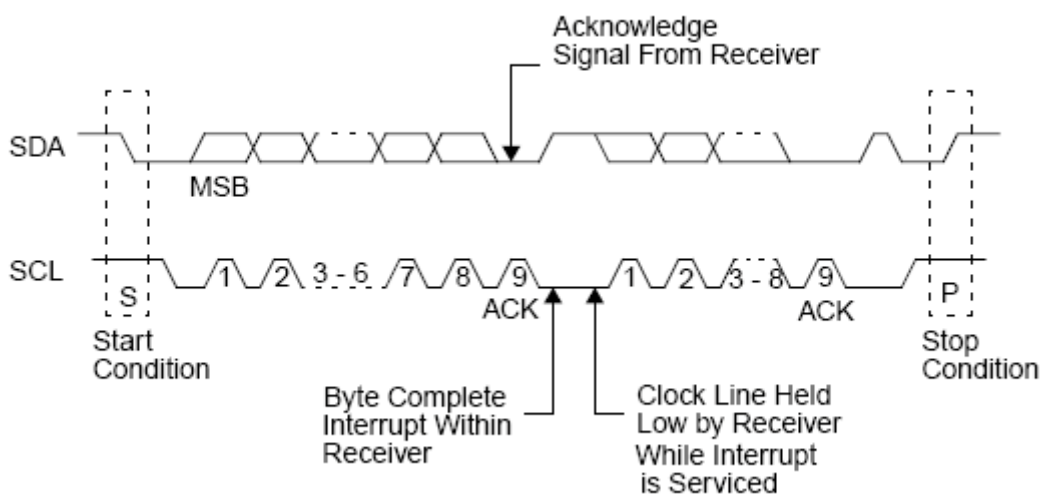

The Master generates Start and Stop conditions at the beginning and end of each transaction.

- Start: High to low transition (falling edge) of SDA while SCL is high
- Stop: Low to high transition (rising edge) of SDA while SCL is high

**Figure 3. Start and Stop Conditions**

The Master generates 9 clock pulses for each byte transfer. The 9th clock pulse constitutes the ACK cycle. The transmitter releases SDA to allow the receiver to send the ACK signal. An ACK is when the device pulls SDA low, while a NACK is recorded if the line remains high.

**Figure 4. Acknowledge (ACK)**

Writing data from a master to a slave comprises of 3 parts as noted in figure [Figure 5](#)

- The master begins with start condition followed by the slave device address with the R/W bit cleared
- The 8-bit register address that will be written
- The data byte to write

**Figure 5. SMBus Write Operation**

SMBus read operation consists of four parts

- The master initiates the read cycle with start condition followed by slave device address with the R/W bit cleared
- The 8-bit register address that is to be read
- After acknowledgment from the slave, the master initiates a re-start condition
- The slave device address is resent followed with R/W bit set
- After acknowledgment from the slave, the data is read back from the slave to the master. The last ACK is high if there are no more bytes to read

**Figure 6. SMBus Read Operation**

**Figure 7. SMBus Timing Parameters**

### 8.3.7.7 SPI Mode

The SPI (Serial Peripheral Interface) bus standard can be used to control the device. The SPI Mode is enabled when MODE\_SEL Pin 1 is pulled high through the 1-kΩ resistor. The SPI bus comprises of 4 pins: Pin 2, Pin 3, Pin 4, and Pin 15:

1. MOSI Pin 4: Master Output Slave Input. Configured as toggling input.
2. MISO Pin 15: Master Input, Slave Output: Configured as a toggling output
3. SS\_N Pin 2: Slave Select (active low). Configured as toggling input.
4. SCK Pin 3: Serial clock (output from master). Configured as toggling input.

The maximum operating speed supported on the SPI bus is 20 MHz.

#### 8.3.7.7.1 SPI READ/WRITE Transaction

Each SPI transaction to a single device is 17 bits long and is framed by SS\_N asserted low. The MOSI input is ignored and the MISO output is floated whenever SS\_N is de-asserted (High).

The bits are shifted in left-to-right. The first bit is R/W, so it is 1 for reads and 0 for writes. Bits A7-A0 are the 8-bit register address, and bits D7-D0 are the 8-bit read or write data. The prior SPI command, address, and data are shifted out on MISO as the current command, address, and data are shifted in on MOSI. In all SPI transactions, the MISO output signal is enabled asynchronously when SS\_N becomes asserted.

R/W	A7	A6	A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0
-----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----

**Figure 8. MOSI Format**

#### 8.3.7.7.2 SPI Write Transaction Format

For SPI writes, the R/W bit is 0. SPI write transactions are 17 bits per device, and the command is executed on the rising edge of SS\_N, as shown in Figure 9. The SPI transaction always starts on the rising edge of the clock.

**Figure 9. MOSI Write Sequence**

0	A7	A6	A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0
---	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----

The signal timing for a SPI Write transaction is shown in Figure 10. The “prime” values on MISO (for example, A7’) reflect the contents of the shift register from the previous SPI transaction, and are a “don’t-care” for the current transaction.

**Figure 10. Signal Timing for a SPI Write Transaction**

### 8.3.7.7.3 SPI Read Transaction Format

An SPI read transaction is 34 bits per device consisting of two 17-bit frames. The first 17-bit read transaction, first frame, shifts in the address to be read, followed by a dummy transaction, second frame, to shift out the 17-bit read data. The R/W bit is 1 for the read transaction, as shown in Figure 11.

The first 17 bits from the read transaction specifies 1-bit of RW and 8-bits of address A7-A0. The eight 1's following the address are ignored. The second dummy transaction acts like a read operation on address 0xFF and needs to be ignored. However, the transaction is necessary in order to shift out the read data D7-D0 in the last 8 bits of the MISO output.

The signal timing for a SPI read transaction is shown in Figure 11. As with the SPI write, the “prime” values on MISO during the first 16 clocks are a don't-care for this portion of the transaction. Note, that the values shifted out on MISO during the last 17 clocks reflect the read address and 8-bit read data for the current transaction.

**Figure 11. Signal Timing for a SPI Read Transaction**

### 8.3.7.8 SPI Daisy Chain

The LMH0318 includes an enhanced SPI controller that supports daisy-chaining the serial configuration data among multiple LMH0318 devices. The LMH0318 device supports SPI Daisy Chain between devices with an 8-bit SPI addressing scheme. Each LMH0318 device is directly connected to the SCK and SS\_N pins of the Host. However, only the first LMH0318 device in the chain is connected to the Host's MOSI pin, and only the last device in the chain is connected to the Host's MISO pin. The MOSI pin of each intermediate LMH0318 device in the chain is connected to the MISO pin of the previous LMH0318 device, thereby creating a serial shift register. This architecture is shown in Figure 12.

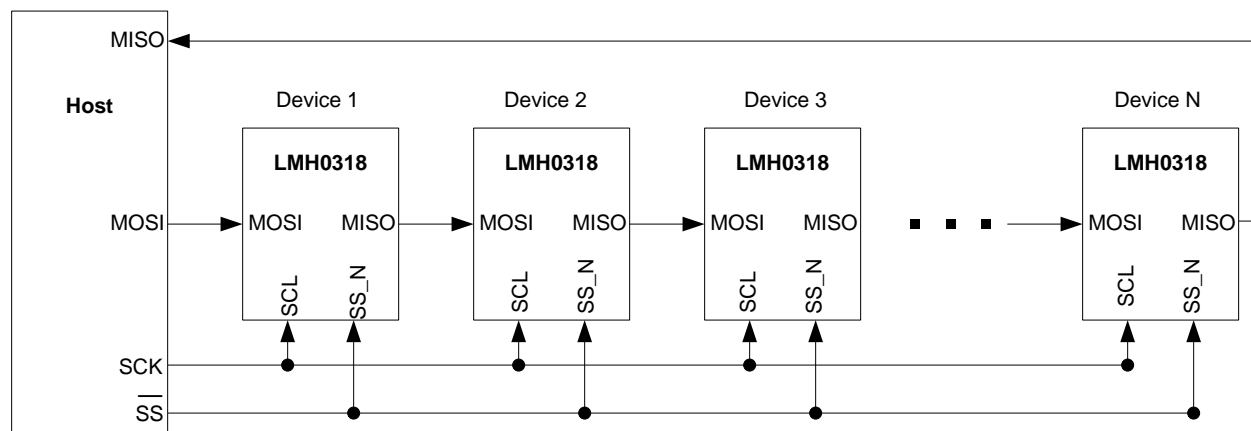

Figure 12. Daisy-Chain Configuration

In a daisy-chain configuration of N LMH0318 devices, the Host conceptually sees a long shift register of length  $17 \times N$ . Therefore the length of a Basic SPI Transaction, as described above, is  $17 \times N$ ; in other words, SS\_N is asserted for  $17 \times N$  clock cycles.

#### 8.3.7.8.1 SPI Daisy Chain Write Example

The following example make some assumptions:

The daisy-chain is 3 LMH0318 devices long, comprising Devices 1, 2, and 3 as shown in Figure 12. Therefore, each Basic SPI Transaction is  $17 \times 3 = 51$  clocks long.

In Figure 13, the following occurs at the end of the transaction:

- Write 0x5A to register 0x12 in Device 3
- Write 0x3C to register 0x34 in Device 2
- Write 0x00 to register 0x56 in Device 1

Note that the bits are shifted out of MOSI left to right. The MISO pin is not shown as it reflects shift register contents from a prior transaction.

MOSI (Write)	0	0x12	0x5A	0	0x34	0x3C	0	0x56	0x00
-----------------	---	------	------	---	------	------	---	------	------

Figure 13. MOSI Write Example

### 8.3.7.8.2 SPI Daisy Chain Write Read Example

In [Figure 14](#) and [Figure 15](#), the following occurs at the end of the first transaction:

- Write 0x22 to register 0x01 in Device 3
- Latch the data from register 0x34 in Device 2
- Write 0x44 to register 0x76 in Device 1

MOSI (Host)	0	0x01	0x22	1	0x34	0xFF	0	0x76	0x44
----------------	---	------	------	---	------	------	---	------	------

**Figure 14. SPI Daisy Chain Write Read First Frame Illustration**

MOSI (Host)	1	0xFF	0xFF	1	0xFF	0xFF	1	0xFF	0xFF
MISO (Host)	0	0x01	0x22	1	0x34	0x3C	0	0x76	0x44

**Figure 15. SPI Daisy Chain Write Read second Frame Illustration**

#### 8.3.7.8.2.1 SPI Daisy Chain Length of Daisy Chain Illustration

A useful operation for the Host may be to detect the length of the daisy-chain. This is a simple matter of shifting in a series of known data values (0x7F, 0xAA) in the example in [Figure 16](#). After N+1 writes, the known data value will begin to appear on the Host's MISO pin.

MOSI (Host)	1	0x7F	0xAA	1	0x7F	0xAA	1	0x7F	0xAA
MISO (Host)	x	xx	xx	x	xx	xx	1	0x7F	0xAA

**Figure 16. MOSI (Host)**

### 8.3.8 Power-On Reset

The LMH0318 has an internal power-on reset (PoR) circuitry which initiates a self-clearing reset after the power is applied to the VDD pins.

## 8.4 Device Functional Modes

The LMH0318 features can be programmed via SPI, or SMBus interface. [LMH0318 Device Configuration](#) describes detailed operation using SPI, or SMBus interface.

## 8.5 Programming

For more information on device programming, See [LMH0318 Programming Guide \(SNLU183\)](#). Register initialization is required at power-up or after reset. See [Initialization Set Up](#)

## Programming (continued)

### 8.5.1 Register Maps

The LMH0318 register set definition is organized into four groups:

1. Global Registers: Chip ID, Interrupt status, LOS registers
2. Receiver Registers: Equalizer boost settings and signal detect setting
3. CDR Registers: PLL control
4. Transmitter Registers: OUT0 and OUT1 parameter setting

The typical device initialization sequence for the LMH0318 includes the followings. For detailed register settings See *LMH0318 Programming Guide* ([SNLU183](#)).

1. Shared Register Configuration
  - (a) Reading device ID
  - (b) Selecting interrupt on to LOS pin
  - (c) Settings up the register to access the channel registers
2. Channel Register Configuration
  - (a) CDR Reset
  - (b) Interrupt register configuration
  - (c) Optional Input/Output selection
  - (d) Optional VOD selection
  - (e) CDR Reset and Release

### 8.5.2 Global Registers

**Table 5. Global Registers**

REGISTER NAME	BITS	FIELD REGISTER ADDRESS	DEFAULT	R/RW	DESCRIPTION
SMBus Observation		Reg_0x00 Share	0x00		SMBus Address Observation

REGISTER NAME	BITS	FIELD REGISTER ADDRESS	DEFAULT	R/RW	DESCRIPTION
Interrupt Control		Reg 0x56 Channel	0x00		Interrupt Mask
	7	Reserved	0	RW	
	6	cdr_lock_int_en	0	RW	1: Enable Interrupt if CDR lock is achieved 0: Disable interrupt if CDR lock is achieved
	5	signal_det1_int_en	0	RW	1: Enable interrupt if IN1 Signal Detect is asserted 0: Disable interrupt if IN1 Signal Detect is asserted
	4	signal_det0_int_en	0	RW	1: Enable interrupt if IN0 Signal Detect is asserted 0: Disable interrupt if IN0 Signal Detect is asserted
	3	heo_veo_int_en	0	RW	1: Enable interrupt if HEO-VEO threshold is reached 0: Disable interrupt due to HEO-VEO threshold
	2	cdr_lock_loss_int_en	0	RW	1: Enable interrupt if CDR loses lock 0: Disable interrupt if CDR loses lock
	1	signal_det1_loss_int_en	0	RW	1: Enable interrupt if there is loss of signal on IN1 0: Disable interrupt if there is loss of signal on IN1
	0	signal_det0_loss_int_en	0	RW	1: Enable interrupt if there is loss of signal on IN0 0: Disable interrupt if there is loss of signal on IN0

### 8.5.3 Receiver Registers

**Table 6. Receiver Registers**

REGISTER NAME	BITS	FIELD REGISTER ADDRESS	DEFAULT	R/RW	DESCRIPTION
EQ_Boost		Reg 0x03 Channel	0x80		4 Stage EQ Boost Levels. Read-back value going to CTLE in reg_0x52. Used for setting EQ value when reg_0x2D[3] is high
	7	eq_BST0[1]	1	RW	2 Bits control for stage 0 of the CTLE. Adapts during CTLE adaptation
	6	eq_BST0[0]	0	RW	
	5	eq_BST1[1]	0	RW	2 Bits control for stage 1 of the CTLE. Adapts during CTLE adaptation
	4	eq_BST1[0]	0	RW	
	3	eq_BST2[1]	0	RW	2 Bits control for stage 2 of the CTLE. Adapts during CTLE adaptation
	2	eq_BST2[0]	0	RW	
	1	eq_BST3[1]	0	RW	2 Bits control for stage 3 of the CTLE. Adapts during CTLE adaptation
	0	eq_BST3[0]	0	RW	
SD_EQ		Reg_0x0D Channel	0x00		270 Mbps EQ Boost Setting
	7	Reserved	0	RW	
	6	Reserved	0	RW	
	5	Reserved	0	RW	
	4	Reserved	0	RW	
	3	Reserved	0	RW	
	2	Reserved	0	RW	
	1	Reserved	0	RW	
	0	Mr_auto_eq_en_bypass	0	RW	1: EQ Bypass for 270 Mbps 0: Use EQ Settings in reg0x03[7:0] for 270 Mbps Note: If 0x13[1] mr_eq_en_bypass is set, bypass would be set and auto-bypass has no significance.
EQ_SD_CONFIG		Reg 0x13 Channel	0x90		Channel EQ Bypass and Power Down
	7	Reserved	1	RW	
	6	sd_0_PD	0	RW	1: Power Down IN0 Signal Detect 0: IN0 Signal Detect normal operation
	5	sd_1_PD	0	RW	1: Power Down IN1 Signal Detect 0: IN1 Signal Detect normal operation
	4	Reserved	1	RW	
	3	eq_PD_EQ	0	RW	Controls the power-state of the selected channel. The un-selected channel is always powered-down 1: Powers down selected channel EQ stage 0: Powers up EQ of the selected channel
	2	Reserved	0	RW	
	1	eq_en_bypass	0	RW	1: Bypass stage 3 and 4 of CTLE 0: Enable Stage 3 and 4 of CTLE
	0	Reserved	0	RW	

**Table 6. Receiver Registers (continued)**

REGISTER NAME	BITS	FIELD REGISTER ADDRESS	DEFAULT	R/RW	DESCRIPTION

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The LMH0318 is a single channel SDI reclocker with integrated cable driver that supports different application spaces. The following sections describe the typical use cases and common implementation practices.

#### 9.1.1 General Guidance for All Applications

The LMH0318 supports two modes of configuration: SPI Mode, and SMBus Mode. Once one of these two control mechanism is chosen, pay attention to the PCB layout for the high speed signals. The LMH0318 has strong equalization capabilities that allow it to recover data over lossy channels. As a result, the optimal placement for the LMH0318 is with the higher loss channel at its input and lower loss channel segment at the output in order to meet the various SMPTE requirements. The SMPTE specifications also define the use of AC coupling capacitors for transporting uncompressed serial data streams with heavy low frequency content. This specification requires the use of a 4.7  $\mu\text{F}$  AC coupling capacitor to avoid low frequency DC wander. The 75  $\Omega$  signal is also required to meet certain rise/fall timing to facilitate highest eye opening for the receiving device. The LMH0318 built-in 75  $\Omega$  termination minimizes parasitic, improving overall signal integrity. Note: When the FPGA is not transmitting valid SMPTE data, the FPGA output should be muted (P=N).

### 9.2 Typical Application

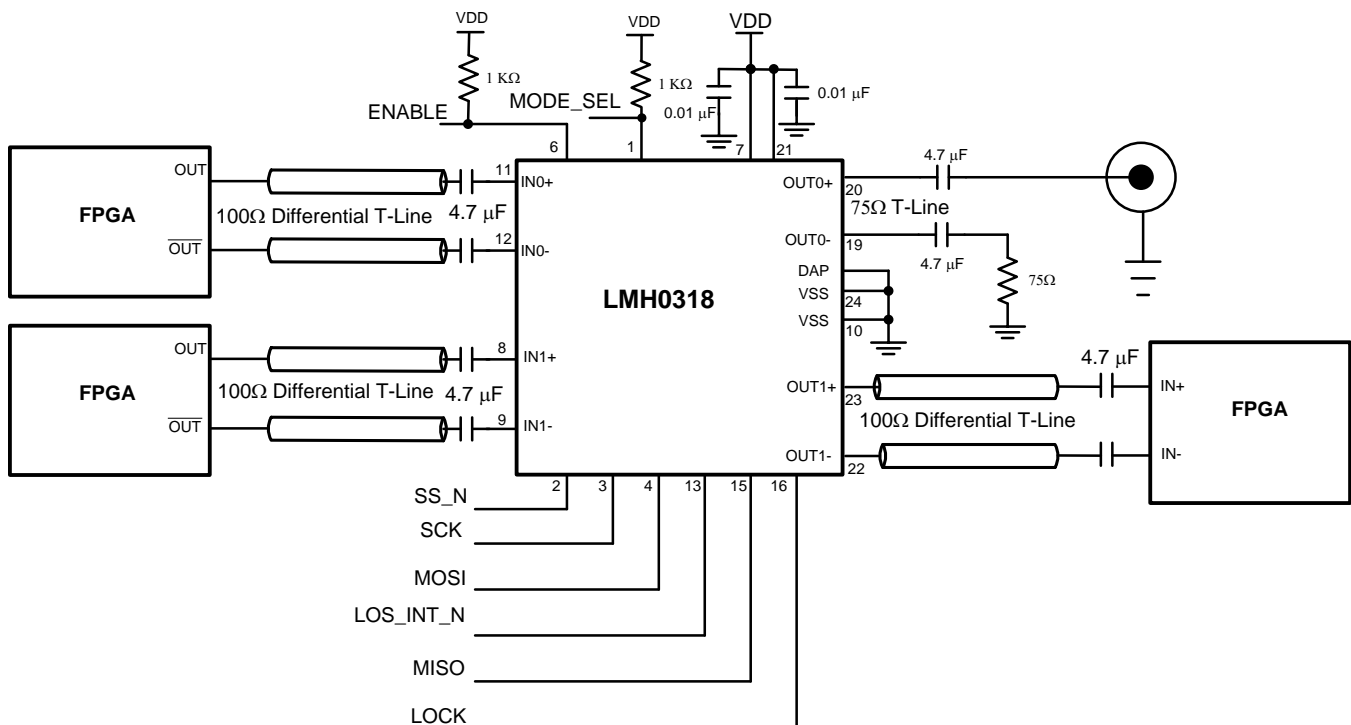

Figure 17. LMH0318 SPI Mode Configuration

## Typical Application (continued)

SMPTE specifies the requirements for the Serial Digital Interface to transport digital video at SD, HD, 3Gb/s and higher data rates over coaxial cables. One of the requirements is meeting the required return loss. This requirement specifies how closely the port resembles 75  $\Omega$  impedance across a specified frequency band. Output return loss is dependent on board design. The LMH0318 meets this requirement. To gain additional return loss margin, a return loss network, as shown in Figure 18, can be used on the output .

**Figure 18. LMH0318 SPI Mode Configuration with Return Loss Network**

### 9.2.1 Design Requirements

For the LMH0318 design example, the requirements noted in Table 9 apply.

**Table 9. LMH0318 Design Parameters**

DESIGN PARAMETER	REQUIREMENT
Input AC coupling capacitors	Required. 4.7 $\mu$ F AC coupling capacitors are recommended. Capacitors may be implemented on the PCB or in the connector.
Output AC coupling capacitors	Required. Both OUT0 and OUT1 require AC coupling capacitors. OUT0 AC Coupling capacitors is expected to be 4.7 $\mu$ F to comply with SMPTE wander requirement.
DC Power Supply Coupling Capacitors	To minimize power supply noise, use 0.01 $\mu$ F capacitors as close to the device VDD pins as possible.
Distance from Device to BNC	Keep this distance as short as possible.
High Speed IN0, IN1, OUT0, and OUT1 trace impedance	Design differential trace impedance of IN0, IN1, and OUT1 with 100 $\Omega \pm 5\%$ , single-ended trace impedance for OUT0 with 75 $\Omega \pm 5\%$

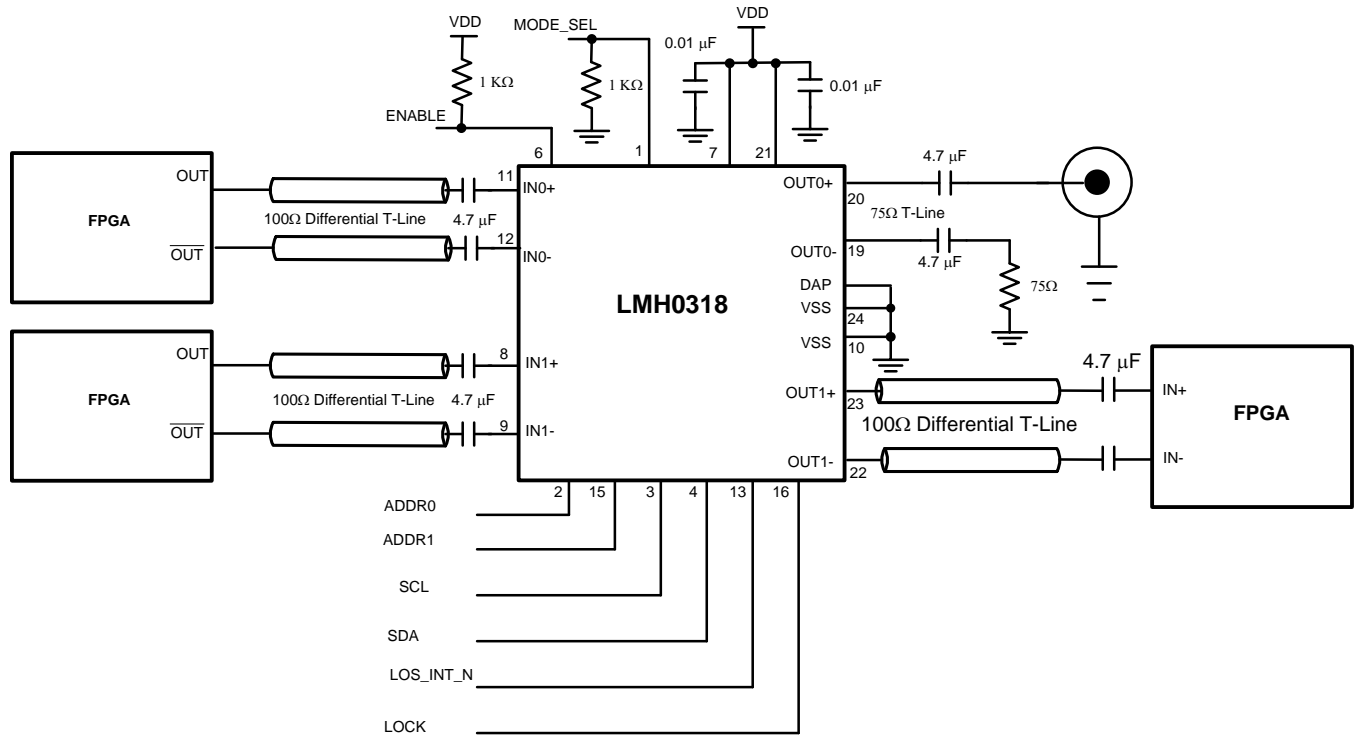

Figure 19. LMH0318 SMBus Mode Configuration

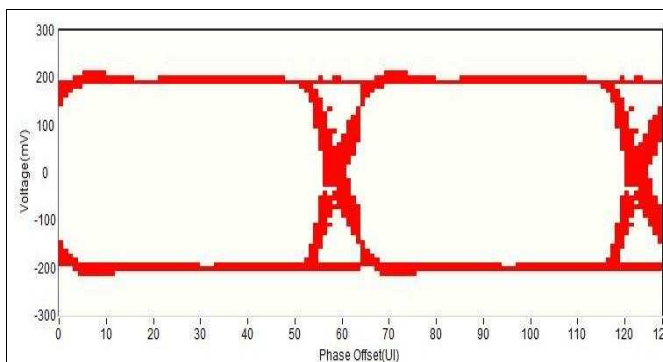

### 9.2.2 Detailed Design Procedure

To begin the design process, determine the following:

1. Maximum power draw for PCB regulator selection. In this case, use the transient CDR power (during acquisition) specified in the datasheet, multiplied by the number of channels.
2. Maximum operational power for thermal calculation. For thermal calculation, use the locked power number. Transient power consumption is only observed during lock acquisition, which typically lasts for <5ms. Additional margin can be applied in case of unsupported data rates being applied which extend the lock time. Note that the CDR should operate in bypass mode for any unsupported data rates.
3. Consult the BNC vendor for optimum BNC landing pattern.
4. Use IBIS-AMI model for simple channel simulation before PCB layout.
5. Closely compare schematic against typical connection diagram in the data sheet.
6. Plan out the PCB layout and component placement to minimize parasitic.

### 9.2.3 Application Curves

Two common ways to visualize this data are shown in [Figure 20](#) and [Figure 21](#). These diagrams depict examples of eye monitor plot implemented by software. The first plot is an example of using the EOM data to plot a basic eye using ASCII characters, which can be useful for simple diagnostics software. The second plot shows the first derivative of the EOM data, revealing the density of hits and the actual waveforms and crossing that comprise the eye. Measurements were done at default operating conditions.

**Figure 20. Internal Input Eye Monitor Plot at 2.97 Gbps, PRBS10**

**Figure 21. Internal Eye Monitor Hit Density Plot at 2.97 Gbps, PRBS10**

### 9.3 Do's and Don'ts

In order to meet SMPTE standard requirements for jitter, AC timing, and return loss use the following guidelines:

1. Do place BNC as close to the device as possible.
2. Do consult BNC vendor to provide optimum landing pad for the BNC to comply with the required specifications.
3. Place return loss network as close to the device as possible.
4. Do pay attention to the recommended solder paste to ensure reliable GND connection to DAP.
5. Do use control impedance for both 100  $\Omega$  and 75  $\Omega$  for IN0/1 and OUT0/1.

### 9.4 Initialization Set Up

After power up or register reset write the initialization sequences in [Table 10](#).

**Table 10. LMH0318 Register Initialization**

DESCRIPTION	ADDRESS [Hex]	VALUE [Hex]
Enable Channel Registers	0xFF	0x04
Enable Full Temperature Range	0x16	0x25
Initialize CDR State Machine Control	0x3E	0x00
	0x55	0x02
	0x6A	0x00
Restore media CTLE setting <sup>(1)</sup>	0x03	xx <sup>(2)</sup>
Reset CDR	0x0A	0x5C
Release Reset	0x0A	0x50

(1) See *LMH0318 Programming Guide* ([SNLU183](#)) on how to quickly select the most appropriate CTLE boost setting.

(2) xx Value depends on media loss characteristics

## 10 Power Supply Recommendations

Follow these general guidelines when designing the power supply:

1. The power supply should be designed to provide the recommended operating conditions in terms of DC voltage, AC noise, and start-up ramp time.
2. The maximum current draw for the LMH0318 is provided in the data sheet. This figure can be used to calculate the maximum current the supply must provide. Current consumption can be derived from the typical power consumption specification in the data sheet.
3. The LMH0318 does not require any special power supply filtering, provided the recommended operating conditions are met. Only standard supply decoupling is required.

## 11 Layout

### 11.1 Layout Guidelines

The following guidelines should be followed when designing the layout:

1. Set trace impedances to  $75\ \Omega \pm 5\%$  single ended,  $100\ \Omega \pm 5\%$  differential.
2. Maintain the same signal reference plane for  $75\ \Omega$  single-end trace, and reference plane for  $100\ \Omega$  differential traces.
3. Use the smallest size surface mount components.
4. Use solid planes. Provide GND or VDD relief under the component pads to minimize parasitic capacitance.
5. Select trace widths that minimize the impedance mismatch along the signal path.
6. Select a board stack-up that supports  $75\ \Omega$  or  $50\ \Omega$  single-end trace,  $100\ \Omega$  coupled differential traces.
7. Use surface mount ceramic capacitors.
8. Place return loss network as close to the device as possible.
9. Maintain symmetry on the complimentary signals.
10. Route  $100\ \Omega$  traces uniformly (keep trace widths and trace spacing uniform along the trace).
11. Avoid sharp bends; use 45-degree or radial bends.
12. Walk along the signal path, identify geometry changes and estimate their impedance changes.
13. Maintain  $75\ \Omega$  impedance with a well-designed connectors' footprint.
14. Consult a 3-D simulation tool to guide layout decisions.
15. Use the shortest path for VDD and Ground hook-ups; connect pin to planes with vias to minimize or eliminate trace.
16. When a high speed trace changes layer, provide at least 2 return vias to improve current return path.

### 11.2 Layout Example

The following example layout demonstrates how the thermal pad should be laid out using standard WQFN board routing guidelines.

Note: Thermal pad is divided into 4 squares with solder paste

**Figure 22. LMH0318 Recommended Four Squares Solder Paste**

## Layout Example (continued)

5 Vias without solder paste are located between 4 squares solder paste

**Figure 23. LMH0318 Recommended Solder Paste Mask and vias**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMH0318RTWR	ACTIVE	WQFN	RTW	24	3000	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	L0318A1	<a href="#">Samples</a>
LMH0318RTWT	ACTIVE	WQFN	RTW	24	250	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	L0318A1	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LMH0318RTWR	WQFN	RTW	24	3000	330.0	12.4	4.3	4.3	1.3	8.0	12.0	Q1

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
