

## High-Efficiency Integrated Dimming LED Lighting Controller

Check for Samples: [TPS92070](#)

### FEATURES

- **Advanced Integrated Dimming Interface**
- **Non-Dissipative TRIAC Dimmer Management**
- **Lamp-to-Lamp Uniformity During Dimming**
- **No Low-Frequency Photometric Ripple**
- **Exponential Dimming Profile**
- **Innovative Secondary-Side Feedback Eliminates Optocoupler Devices**
- **LED Current Regulation better than 5%**
- **Programmable Minimum LED Current**
- **Valley Switching and DCM Operation for Reduced EMI and Improved Efficiency**
- **Leading Edge Dimmer Detection**
- **Power Factor > 0.8**
- **Cycle-by-Cycle Current Limit Protection**
- **Low Start-Up and Standby Currents**
- **Integrated PWM MOSFET Driver**
- **Thermal Shutdown**
- **16-Pin, TSSOP package**

### APPLICATIONS

- **LED Light Bulb Replacement**
- **LED Luminaires**
- **LED Downlights**
- **LED Wall Washers**

### DESCRIPTION

The TPS92070 is an advanced PWM controller ideal for use in low-power, offline, LED lighting applications. The integrated dimming interface circuit of the TPS92070 features a non-dissipative dimmer trigger control circuit. The TPS92070 controller provides DC LED current with no photometric ripple effects. The DC current also results in higher efficacy of the LEDs. The TPS92070 provides exponentially controlled light output based on the external dimmer position. High power factor is achieved with a valley fill circuit. Once a leading-edge dimmer is detected, the TPS92070 sets an output to disable the PFC circuit and thus optimizes driver operation. The LED current sense precision error amplifier implements deep dimming. The TPS92070 current sensing scheme provides tight current regulation and eliminates the need for an optocoupler. The tight current regulation allows for strong color and intensity matching amongst individual bulbs or luminaires.

The TPS92070 also contains a variety of protection features including cycle-by-cycle peak-current limit, overcurrent protection, open-LED (output overvoltage) protection, undervoltage lockout, and thermal shutdown.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## APPLICATION DIAGRAM

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ORDERING INFORMATION<sup>(1)(2)</sup>

TEMPERATURE RANGE (T <sub>J</sub> )	PACKAGE	PINS	TRANSPORT MATERIAL	UNITS	ORDERABLE NUMBER
–40°C to 140°C	Plastic TSSOP	16	Tube	70	TPS92070PW
			Tape and Reel	2000	TPS92070PWR

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at [www.ti.com](http://www.ti.com).
- (2) Package drawings, thermal data, and symbolization are available at [www.ti.com/packaging](http://www.ti.com/packaging)

### ABSOLUTE MAXIMUM RATINGS<sup>(1)(2)(3)</sup>

All voltages are with respect to GND, –40°C < T<sub>J</sub> = T<sub>A</sub> < 125°C, all currents are positive into and negative out of the specified terminal (unless otherwise noted)

		VALUE		UNITS
		MIN	MAX	
Supply voltage	VDD <sup>(4)</sup>	–0.3	25.0	
Input voltages	ISO, CS, COMP, LP, MIN, SEN, PCS	–0.3	7.0	
	BP, GATE, TDD	–0.3	7.2	
	VD	–1.4	7.0	
	VZ, DTC <sup>(5)</sup>	–0.3	20.0	
Input current	VZ (pulse < 1 ms)		5	mA
	BP	–0.5	0	
	DTC	Peak	30	
		Average	16	
	VDD		5	
Operating junction temperature <sup>(6)</sup>		–40	140	°C
Storage temperature <sup>(6)</sup>		–65	150	°C
Lead temperature (10 seconds)			260	°C

- (1) These are stress ratings only. Stress beyond these limits may cause permanent damage to the device. Functional operation of the device at these or any conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute maximum rated conditions for extended periods of time may affect device reliability
- (2) All voltages are with respect to GND.
- (3) All currents are positive into the terminal, negative out of the terminal.
- (4) VDD clamped at approximately 23 V. See [ELECTRICAL CHARACTERISTICS](#) table.
- (5) VZ clamped at approximately 12.5 V. See [ELECTRICAL CHARACTERISTICS](#) table.
- (6) Higher temperature may be applied during board soldering process according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

## RECOMMENDED OPERATING CONDITIONS

Unless otherwise noted, all voltages are with respect to GND,  $-40^{\circ}\text{C} < T_J = T_A < 125^{\circ}\text{C}$ .

		MIN	TYP	MAX	UNIT
VDD	Input Voltage	9		21.5	V
VZ	Current	1		100	$\mu\text{A}$
R <sub>MIN</sub>	Resistor from MIN to GND <sup>(1)</sup>	25		75	k $\Omega$
R <sub>VD1</sub>	Valley detect resistor from AUX winding to VD pin	50		200	k $\Omega$
C <sub>VZ</sub>	VZ bypass capacitor	1		4.7	nF
C <sub>BP</sub>	BP capacitor	0.47	1		$\mu\text{F}$
C <sub>VDD</sub>	VDD capacitor	10×C <sub>BP7</sub>	4.7		$\mu\text{F}$
C <sub>VDD,BP</sub>	VDD bypass capacitor, ceramic <sup>(2)</sup>	0.1			$\mu\text{F}$

- (1) R<sub>MIN</sub> values greater than 75K will produce lower minimum current values. However accuracy of the minimum current will degrade, and there may be flickering at very low values of I<sub>min</sub>.
- (2) If a ceramic capacitor is used for C<sub>VDD</sub> then this capacitor is not needed.

## ELECTROSTATIC DISCHARGE (ESD) PROTECTION

## DEVICE INFORMATION

### FUNCTIONAL BLOCK DIAGRAM

UDG-11186

**TPS92070  
PW (TSSOP) PACKAGE  
(TOP VIEW)**

**PIN DESCRIPTIONS**

PIN		DESCRIPTION
NAME	NO.	
BP	1	Connect a 1-uF ceramic capacitor to GND to bypass the internal voltage regulator.
COMP	7	Loop compensation output. Connect the loop compensation components between this pin and GND
CS	6	LED current sense feedback and positive input terminal of the error amplifier.
DTC	12	Dimmer trigger control input. Connect this pin to the source of the HV N-channel MOSFET cascode device of the DTC circuit.
GATE	16	PWM drive signal output. Connect to flyback power MOSFET.
GND	3	Ground for internal circuitry
ISO	5	Inverting input of secondary side current sense comparator and isolation transformer buffer. Connect to GND for non-isolated applications.
LP	8	Pole for DTC low pass filter. Connect a capacitor to GND to set the response time of the dimming level detection circuit.
MIN	9	Minimum current programming input. Connect a resistor to GND to set the minimum LED current.
PCS	14	Primary current sense input. Connected to shunt resistor for primary side current sense.
PGND	13	Power ground for GATE Driver. Connected to GND <sup>(1)</sup>
SEN	10	Dimmer sense input. An internal window comparator continuously monitors this pin to determine the dimmer setting.
TDD	15	TRIAC dimmer detect. Drives bypass FET in Valley Fill PFC when dimmer is detected. For non PFC applications, leave this pin open
VD	4	Valley detect input. Connect to the Aux winding through a resistor divider.
VDD	2	Provides power to the device. Connect a bypass capacitor directly to GND. See <a href="#">RECOMMENDED OPERATING CONDITIONS</a> for suggested values.
VZ	11	Voltage clamp. This pin clamps the maximum voltage on the gate of the external HV DTC N-channel MOSFET.

(1) See Application Section for layout recommendations

## TYPICAL CHARACTERISTICS

Unless otherwise stated,  $-40^{\circ}\text{C} \leq T_A = T_J \leq +125^{\circ}\text{C}$ ,  $V_{DD} = 12\text{ V}$ ,  $\text{GND} = 0\text{V}$ ,  $I_{VZ} = 50\text{ }\mu\text{A}$ ,  $R_{\text{MIN}} = 71.5\text{ k}\Omega$ ,  $C_{VDD} = 10\text{ }\mu\text{F}$ ,  $C_{VZ} = 1\text{ nF}$ ,  $C_{LP} = 220\text{ nF}$

Figure 4. Minimum Current Sense Voltage vs. Temperature

## APPLICATIONS

### STARTUP BIAS AND UVLO

During powerup when VDD is less than the UVLO threshold of 8 V, the VZ pin is trickle charged with  $I_{VZ(start)}$  of approximately 10  $\mu$ A through the startup-resistor connected to the bulk rectified voltage. As VZ is being charged, VDD tracks VZ (less  $V_{GSTH}$ ) through the external cascode HV MOSFET (Q1) supplying a VDD startup current of 135  $\mu$ A. Once VZ reaches the TPS92070 zener clamp regulation level of 12.5 V, the device enters into a stand-by mode during which the dimmer trigger circuit (DTC), set-point filter, 7-V bias regulator, and a minimal amount of housekeeping circuitry is active. The TPS92070 remains in this state until the SEN pin exceeds 5 V indicating that adequate line voltage is present, either through TRIAC firing, or line voltage presence. The typical start-up waveforms are shown in Figure 5.

Figure 5. Typical Startup Waveforms for a TRIAC Triggered  $V_{IN(ac)}$  Input

UDG-11187

## DTC and PHASE DETECTION

The DTC pin is a current sink which loads the dimmer with approximately 20 mA during the zero-crossing of the AC line to ensure that the TRIAC is reliably triggered. This current sink is switched on when the voltage on the SEN pin is below 5 V. The setpoint filter in conjunction with the SEN and LP pins is used to determine the firing angle of the TRIAC dimmer (if any) connected to the input of the LED driver. An internal window comparator monitors the SEN (dimmer sense input) pin and the resulting duty-cycle is transformed into a voltage at the LP pin using the LP filter. The relation between the TRIAC firing angle and the LP voltage is shown in Figure 6. It illustrates the conversion of the TRIAC firing angle to LP voltage and exponential dimming control of  $I_{SET}$  based on internal control voltage. As the voltage on the LP varies from 0 V to 3 V based on the mapping of 0% to 100% SEN duty-cycle, an internal control voltage is linearly modulated by TPS92070 from 400 mV to 200 mV.

**Figure 6. TRIAC Firing Angle vs. Low-Pass Filter Voltage**

UDG-11194

**Figure 8. Switching Period and PWM Threshold Modulation Based on COMP pin Voltage**

## PRIMARY CURRENT SENSE

The primary current is sensed by monitoring the voltage developed across an external current-sense resistor connected between the source of the external HV MOSFET and PGND. The PCS pin is used for monitoring the voltage and it is then compared with the PWM threshold ( $V_{PWM}$ ). The PWM comparator has a leading-edge blanking time of 220 ns to avoid any false-tripping of the comparator due to capacitive charge spikes on the PCS pin. The GATE output is pulled low once the PCS pin reaches the PWM threshold.

## VALLEY DETECT

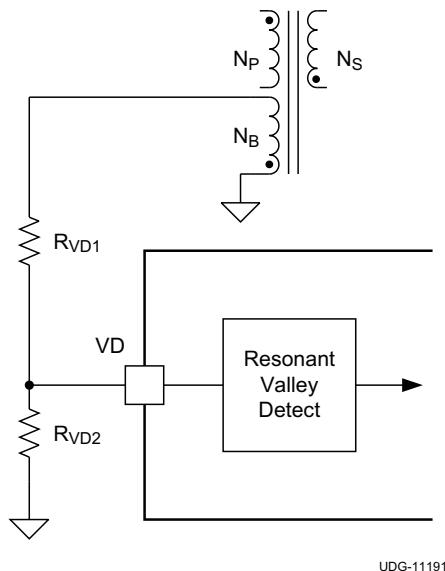

TPS92070 ensures that the flyback converter always operates in either DCM or QR mode of operation and initiates a new PWM switching cycle only after the energy in the flyback transformer is completely reset to zero. This is accomplished by monitoring the auxiliary winding waveform using a resistive divider connected to the VD pin. The TPS92070 initiates a new switching cycle based on the following conditions:

- For normal operation with  $1.63\text{ V} \leq V_{\text{COMP}} \leq 3.7\text{ V}$ , a new PWM switching cycle is initiated when the internal timer  $t_{\text{PERIOD}}$  has expired and the next valley is detected. The VD pin must go below 100 mV ( $V_{\text{VD(zc)}}$ ) prior to valley detection to enable the valley detector circuit.
- In the minimum frequency clamp state when  $V_{\text{COMP}} < 1.63\text{ V}$ , the switching period is fixed at  $t_{\text{PERIOD(max)}}$  (corresponding to  $f_{\text{CLAMP(min)}}$ ) and the valley detector is disabled.
- The relationship of  $t_{\text{PERIOD}}$  to the switching frequency is shown in [Equation 4](#) and [Equation 5](#).

$$f_{\text{CLAMP(max)}} = \frac{1}{t_{\text{PERIOD(min)}}} \quad (4)$$

$$f_{\text{CLAMP(min)}} = \frac{1}{t_{\text{PERIOD(max)}}} \quad (5)$$

By turning on the flyback power switch at the resonant valley, the switching losses are reduced thereby enabling higher efficiency. The voltage at the VD pin is clamped at  $-0.56\text{ V}$  during the negative excursions on the AUX winding when GATE is high. When GATE is low and during the resonant valley detection, the VD pin is clamped at  $-0.2\text{ V}$ . The interface to the VD pin to the AUX winding is shown in [Figure 9](#). The TPS92070 requires that the positive peak of the resonant ring at the VD pin is higher than  $0.6\text{ V}$  ( $V_{\text{VD(en)}}$ ) to ensure that the valley-detect circuit is enabled for detection on the falling edge when  $V_{\text{COMP}} > 1.63\text{ V}$ . Hence,  $R_{\text{VD2}}$  need to be selected in such a way that this condition is met for all AUX voltages when  $V_{\text{COMP}} > 1.63\text{ V}$ . A current  $I_{\text{VD(min)}}$  of at least  $50\text{ }\mu\text{A}$  must be drawn from the VD pin when the GATE is high to ensure proper valley detection. This requirement determines the value of  $R_{\text{VD1}}$ . The waveforms associated with the valley detect are shown in [Figure 10](#). If the voltage at the AUX winding is not sufficient for valley detection when  $V_{\text{COMP}} > 1.63\text{ V}$ , an internal valley wait timer of  $12.7\text{ }\mu\text{s}$  ( $t_{\text{VD(vw)}}$ ) expires after the  $t_{\text{PERIOD}}$  times out. The time out of the valley wait timer would initiate a new PWM switching pulse following the 100 mV threshold crossing on the VD pin.

## TRIAC DIMMER DETECT

The TDD pin is used to drive an external by-pass FET that disables valley-fill PFC when a dimmer is detected by TPS92070. The TDD pin is set to logic high state ( $V_{TDD(oh)} = 7\text{ V}$ ) as the part is powered up and if no dimmer is detected by continuously sensing the SEN pin, the TDD pin is then reset to logic low ( $V_{TDD(ol)} = 0\text{ V}$ ). The presence of a dimmer is detected by monitoring the time delay in a window between 1 V and 5 V comparators that are monitoring the SEN pin. If the rise time from 1 V to 5 V is greater than 135  $\mu\text{s}$  for four consecutive half-line cycles, direct connection to the AC line without dimmer is assumed, and the TDD output goes low. Otherwise the TDD pin remains high. If the TDD pin is low and the delay time ( $t_{DLY\_1V\_5V}$ ) is detected to be less than 135  $\mu\text{s}$ , for four consecutive half-line cycles, the TDD pin goes high once the SEN pin falls below 1 V indicating dimmer detection.

## PROTECTION FEATURES

### Output Over Voltage Protection (OVP)

Output (secondary-side) overvoltage protection / open LED detection is achieved by disabling the controller whenever the VDD voltage rises enough to trigger its internal 23 V clamp. Upon OVP detection, GATE is pulled low and the TDD pin is reset to logic-high state. The TPS92070 is disabled and an internal pull-down resistor ( $R_{VZ(ovp)}$ ) discharges the VZ pin, until the VDD voltage drops below the UVLO threshold when a restart is triggered.

### Overcurrent Protection (OCP)

Overcurrent faults are detected when the PCS pin exceeds the internal 700-mV threshold. Upon the detection of an OCP condition, the GATE signal is pulled low, and the LP pin voltage is reset to 0 V corresponding to the minimum LED output condition. GATE switching and current regulation resumes from the minimum LED light setting once the SEN pin crosses the 5 V.

### Thermal Shutdown (TSD)

TPS92070 is disabled if the junction temperature of the part exceeds approximately 155°C and enters into the restart mode where the VZ pin is discharged until VDD falls below the UVLO threshold. The device stays in this restart mode until the junction temperature falls below approximately 140°C when it resumes normal operation with the light output preset to the minimum setting.

### PCB Layout

Use good layout practices when constructing the PCB. Maintain the location of bypass components close to the pins being bypassed. Route power ground (PGND) separate from signal ground (GND) to keep the high current paths and the small signal paths separate. Connect PGND to GND at a single point, preferably under the device.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
TPS92070PW	ACTIVE	TSSOP	PW	16	90	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	TP92070	<a href="#">Samples</a>
TPS92070PWR	ACTIVE	TSSOP	PW	16	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	TP92070	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

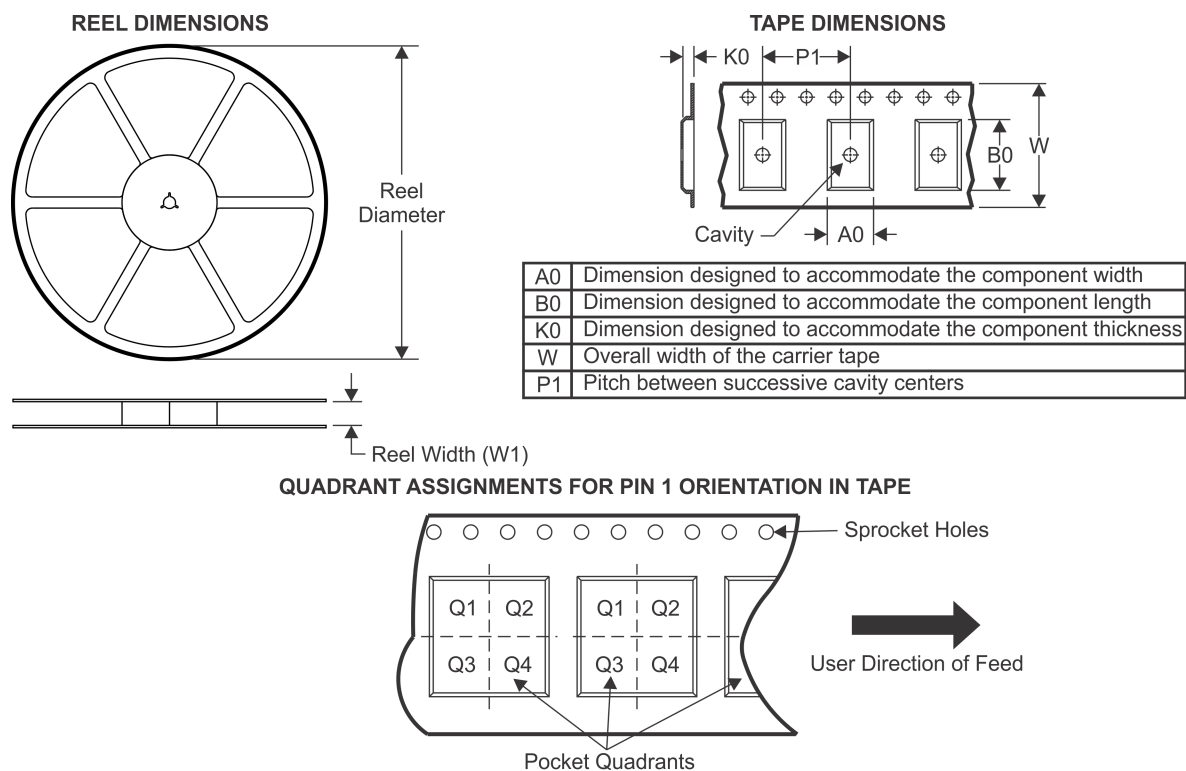

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS92070PWR	TSSOP	PW	16	2000	330.0	12.4	6.9	5.6	1.6	8.0	12.0	Q1

## TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TPS92070PWR	TSSOP	PW	16	2000	367.0	367.0	35.0

PW (R-PDSO-G16)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

PW (R-PDSO-G16)

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
