

bq25100B 250-mA Single Cell Li-Ion Battery Chargers, 1-mA Termination, 75-nA Battery Leakage

1 Features

- Charging
 - 1% Charge Voltage Accuracy
 - 10% Charge Current Accuracy
 - Supports Applications for Very Low Charge Currents - 10 mA to 250 mA
 - Supports Minimum 1-mA Charge Termination Current
 - Ultra Low Battery Output Leakage Current - Maximum 75 nA
 - Adjustable Termination and Precharge Threshold
 - High voltage Chemistry Support: 4.30 V
- Protection
 - 30-V Input Rating; with 6.5-V Input Overvoltage Protection
 - Input Voltage Dynamic Power Management
 - 125°C Thermal Regulation; 150°C Thermal Shutdown Protection
 - OUT Short-Circuit Protection and ISET Short Detection
 - Fixed 10 Hour Safety Timer
- System
 - Automatic Termination and Timer Disable Mode (TTDM) for Absent Battery Pack
 - Available in Small 1.60 mm × 0.90 mm DSBGA Package

2 Applications

- Fitness Accessories
- Smart Watches
- Bluetooth® Headsets
- Low-Power Handheld Devices

3 Description

The bq25100B device is a highly integrated Li-Ion and Li-Pol linear charger targeted at space-limited portable applications. The high input voltage range with input overvoltage protection supports low-cost unregulated adapters.

The bq25100B has a single power output that charges the battery. A system load can be placed in parallel with the battery as long as the average system load does not keep the battery from charging fully during the 10 hour safety timer.

The battery is charged in three phases: conditioning, constant current and constant voltage. In all charge phases, an internal control loop monitors the IC junction temperature and reduces the charge current if an internal temperature threshold is exceeded.

The charger power stage and charge current sense functions are fully integrated. The charger function has high accuracy current and voltage regulation loops and charge termination. The pre-charge current and termination current threshold are programmed via an external resistor on the bq25100B. The fast charge current value is also programmable via an external resistor.

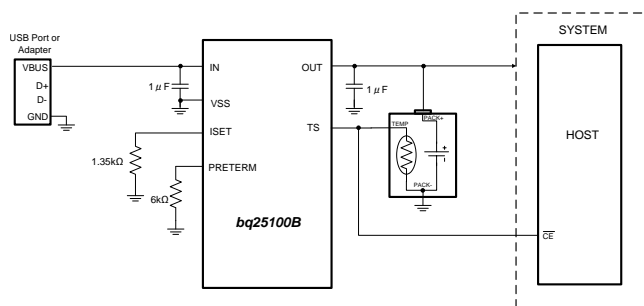

References to other devices in the bq25100B family are included in this document. For more information on those devices, please see their respective datasheets. This includes references to the CHG pin and the JEITA temperature functionality.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|-----------|-------------------|
| bq25100B | DSBGA (6) | 1.60 mm × 0.90 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

Changes from Original (May 2016) to Revision A

Page

| | |
|--|---|
| • Changed $I_{OUT(SC)}$ values From: 9, 11, 13 To: 10, 12, 14 in the Electrical Characteristics table | 5 |
| • Changed $I_{PRE-TERM}$ values From: 23, 25, 27 To: 24.25, 26.25, 28.25 in the Electrical Characteristics table..... | 6 |
| • Changed the $I_{NTC-10k}$ values From: 48.5, 50.5, 52.5 To: 50.5, 52.5, 54.5 in the Electrical Characteristics table | 7 |
| • Changed the $I_{NTC-DIS-10k}$ values From: 27, 30, 33 To: 28, 31, 34 in the Electrical Characteristics table | 7 |
| • Changed the $V_{TS-0^{\circ}C}$ values From: 1230, 1255, 1280 To: 1225, 1250, 1275 in the Electrical Characteristics table | 7 |
| • Changed the $V_{TS-45^{\circ}C}$ values From: 253, 268, 283 To: 255, 267, 279 in the Electrical Characteristics table | 7 |
| • Changed the $V_{TS-EN-10k}$ values From: 84, 92, 100 To: 83, 91, 99 in the Electrical Characteristics table | 8 |

5 Device Comparison Table

| PART NUMBER | V _{O(REG)} | V _{OVP} | PreTerm /CHG | TS |
|-------------------------|---------------------|------------------|--------------|------------|
| bq25100 | 4.20 V | 6.5 V | PreTerm | TS (JEITA) |
| bq25101 | 4.20 V | 6.5 V | CHG | TS (JEITA) |
| bq25100A | 4.30 V | 6.5 V | PreTerm | TS |
| bq25100B ⁽¹⁾ | 4.284 V | 6.5 V | PreTerm | TS |
| bq25100H | 4.35 V | 6.5 V | PreTerm | TS (JEITA) |
| bq25101H | 4.35 V | 6.5 V | CHG | TS (JEITA) |
| bq25100L ⁽²⁾ | 4.06 V | 6.5 V | PreTerm | TS |

(1) The bq25100B is part of the bq25100 family of devices. Please see [Device Support](#) for viewing other devices.

6 Pin Configuration and Functions

Pin Functions

| PIN | | I/O | DESCRIPTION |
|----------|--------|-----|--|
| NAME | NUMBER | | |
| IN | A2 | I | Input power, connected to external DC supply (AC adapter or USB port). Expected range of bypass capacitors 1 μ F to 10 μ F, connect from IN to V _{SS} . |
| ISET | B2 | I | Programs the fast-charge current setting. External resistor from ISET to VSS defines fast charge current value. Recommended range is 13.5 k Ω (10 mA) to 0.54 k Ω (250 mA). |
| OUT | A1 | O | Battery Connection. System Load may be connected. Expected range of bypass capacitors 1 μ F to 10 μ F. |
| PRE-TERM | C1 | I | Programs the current termination threshold (1% to 50% of I _{OUT} , 1 mA minimum). The pre-charge current is twice the termination current level. Expected range of programming resistor is 600 Ω to 30 k Ω (6k: I _{CHG} /10 for term; I _{CHG} /5 for precharge) |
| TS | B1 | I | Temperature sense pin connected to 10k at 25°C NTC thermistor, in the battery pack. Floating TS pin or pulling high puts part in TTDM <i>Charger</i> mode and disables TS monitoring, Timers and Termination. Pulling pin low disables the IC. If NTC sensing is not needed, connect this pin to VSS through an external 10-k Ω resistor. A 250-k Ω resistor from TS to ground will prevent IC entering TTDM mode when battery with thermistor is removed. |
| VSS | C2 | – | Ground pin |

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|-----------------------------|---|------|-----|------|
| Input voltage | IN (with respect to VSS) | −0.3 | 30 | V |
| | OUT (with respect to VSS) | −0.3 | 7 | V |
| | PRE-TERM, ISET, TS, $\overline{\text{CHG}}$ (with respect to VSS) | −0.3 | 7 | V |
| Input current | IN | | 300 | mA |
| Output current (continuous) | OUT | | 300 | mA |
| Output sink current | $\overline{\text{CHG}}$ | | 15 | mA |
| T _J | Junction temperature | −40 | 150 | °C |
| T _{stg} | Storage temperature | −65 | 150 | °C |

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to the network ground terminal unless otherwise noted.

7.2 ESD Ratings

| | | | VALUE | UNIT |
|--------------------|-------------------------|---|--------|------|
| V _(ESD) | Electrostatic discharge | IEC61000-4-2 contact discharge ⁽¹⁾ | ±8000 | V |
| | | IEC61000-4-2 air-gap discharge ⁽¹⁾ | ±15000 | |

- (1) The test was performed on IC pins that may potentially be exposed to the customer at the product level. The bq2510x IC requires a minimum of the listed capacitance, external to the IC, to pass the ESD test.
- (2) 1 μ F between IN (pin A2) and GND,
1 μ F between TS (pin B1) and GND,
2 μ F between OUT (pin A1) and GND,
x5R ceramic or equivalent

7.3 Recommended Operating Conditions

see ⁽¹⁾

| | | MIN | NOM | UNIT |
|-----------------------|---|------|------|------------|
| V _{IN} | IN voltage | 3.5 | 28 | V |
| | IN operating voltage, restricted by V _{DPM} and V _{OV} P | 4.45 | 6.45 | V |
| I _{IN} | Input current, IN pin | | 250 | mA |
| I _{OUT} | Current, OUT pin | | 250 | mA |
| R _{PRE-TERM} | Programs precharge and termination current thresholds | 0.6 | 30 | k Ω |
| R _{ISET} | Fast-charge current programming resistor | 0.54 | 13.5 | k Ω |
| R _{TS} | 10k NTC thermistor range without entering $\overline{\text{BAT_EN}}$ or TTDM | 1.66 | 258 | k Ω |
| T _J | Junction temperature | −5 | 125 | °C |

- (1) Operation with V_{IN} less than 4.5V or in drop-out may result in reduced performance.

7.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | bq25100B | UNIT |
|-------------------------------|--|-------------|------|
| | | YFP (DSBGA) | |
| | | 6 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 132.9 | °C/W |
| R _{θJCTop} | Junction-to-case (top) thermal resistance | 1.3 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance | 21.8 | °C/W |
| ψ _{JT} | Junction-to-top characterization parameter | 5.6 | °C/W |
| ψ _{JB} | Junction-to-board characterization parameter | 21.8 | °C/W |
| R _{θJCbot} | Junction-to-case (bottom) thermal resistance | — | °C/W |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Electrical Characteristics

Over junction temperature range $-5^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$ and recommended supply voltage (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---------------------------------|---|-------------------------------------|------|------|------|
| INPUT | | | | | |
| UVLO | Undervoltage lockout exit V _{IN} : 0 V → 4 V | 3.15 | 3.3 | 3.45 | V |
| V _{HYS_UVLO} | Hysteresis on V _{UVLO_RISE} falling V _{IN} : 4 V → 0 V; V _{UVLO_FALL} = V _{UVLO_RISE} – V _{HYS_UVLO} | | 263 | | mV |
| V _{IN-DT} | Input power good detection threshold is V _{OUT} + V _{IN-DT} V _{OUT} = 3.6 V; V _{IN} : 3.5 V → 4 V | 15 | 60 | 130 | mV |
| V _{HYS-INDT} | Hysteresis on V _{IN-DT} falling V _{OUT} = 3.6 V; V _{IN} : 4 V → 3.5 V | | 31 | | mV |
| t _{DGL(PG_PWR)} | Deglitch time on exiting sleep Time measured from V _{IN} : 0 V → 5 V 1-μs rise-time to charge enables; V _{OUT} = 3.6 V | | 29 | | ms |
| t _{DGL(PG_NO-PWR)} | Deglitch time on V _{HYS-INDT} power down. Same as entering sleep. Time measured from V _{IN} : 5 V → 3.2 V 1-μs fall-time to charge disables; V _{OUT} = 3.6 V | | 29 | | ms |
| V _{OVP} | Input over-voltage protection threshold V _{IN} : 5 V → 12 V | 6.50 | 6.65 | 6.84 | V |
| t _{DGL(OVP-SET)} | Input over-voltage blanking time V _{IN} : 5 V → 12 V | | 113 | | μs |
| V _{HYS-OVP} | Hysteresis on OVP V _{IN} : 11 V → 5 V | | 110 | | mV |
| t _{DGL(OVP-REC)} | Deglitch time exiting OVP Time measured from V _{IN} : 12 V → 5 V 1-μs fall-time to charge enables | | 450 | | μs |
| V _{IN-DPM} | Low input voltage protection. Restricts I _{OUT} at V _{IN-DPM} Limit input source current to 50 mA; V _{OUT} = 3.5 V; R _{ISSET} = 1.35 kΩ | 4.25 | 4.31 | 4.37 | V |
| ISSET SHORT CIRCUIT TEST | | | | | |
| R _{ISSET_SHORT} | Highest resistor value considered a fault (short). R _{ISSET} : 540 Ω → 250 Ω, I _{OUT} latches off; Cycle power to reset | | 426 | 470 | Ω |
| t _{DGL_SHORT} | Deglitch time transition from ISET short to I _{OUT} disable Clear fault by disconnecting IN or cycling (high / low) TS/BAT_EN | | 1 | | ms |
| I _{OUT_CL} | Maximum I _{OUT} current limit regulation (Clamp) V _{IN} = 5 V; V _{OUT} = 3.6 V; R _{ISSET} : 540 Ω → 250 Ω; I _{OUT} latches off after t _{DGL_SHORT} | 550 | 600 | 650 | mA |
| BATTERY SHORT PROTECTION | | | | | |
| V _{OUT(SC)} | OUT pin short-circuit detection threshold/ precharge threshold V _{OUT} : 3 V → 0.5 V; No deglitch | 0.75 | 0.8 | 0.85 | V |
| V _{OUT(SC-HYS)} | OUT pin Short hysteresis Recovery ≥ V _{OUT(SC)} + V _{OUT(SC-HYS)} ; Rising; No deglitch | | 77 | | mV |
| I _{OUT(SC)} | Source current to OUT pin during short-circuit detection | 10 | 12 | 14 | mA |
| QUIESCENT CURRENT | | | | | |
| I _{OUT(PDWN)} | Battery current into OUT pin | V _{IN} = 0 V; 0°C to 125°C | | 80 | nA |
| | | V _{IN} = 0 V; 0°C to 85°C | | 50 | |
| I _{OUT(DONE)} | OUT pin current, charging terminated V _{IN} = 6 V; V _{OUT} > V _{OUT(REG)} | | | 6 | μA |
| I _{IN(STDBY)} | Standby current into IN pin TS = GND; V _{IN} ≤ 6 V | | | 125 | μA |
| I _{CC} | Active supply current, IN pin TS = open, V _{IN} = 6 V; TTDM – no load on OUT pin; V _{OUT} > V _{OUT(REG)} ; IC enabled | | 0.75 | 1 | mA |

Electrical Characteristics (continued)

Over junction temperature range $-5^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$ and recommended supply voltage (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------------------------------|--|---|---|-------|-------|----------------------|
| BATTERY CHARGER FAST-CHARGE | | | | | | |
| V _{OUT(REG)} | Output voltage | T _J = -5°C to 125°C; I _{OUT} = 0 mA to 250 mA; V _{IN} = 5.0 V; V _{TS-45°C} ≤ V _{TS} ≤ V _{TS-0°C} (bq25100B) | 4.25 | 4.284 | 4.305 | V |
| | | T _J = -5°C to 55°C; I _{OUT} = 10mA to 75 mA; V _{IN} = 5.0 V; V _{TS-45°C} ≤ V _{TS} ≤ V _{TS-0°C} (bq25100B) | 4.266 | 4.284 | 4.305 | |
| I _{OUT(RANGE)} | Programmed output “fast charge” current range | V _{OUT(REG)} > V _{OUT} > V _{LOWV} ; V _{IN} = 5 V; R _{ISET} = 0.54 kΩ to 13.5 kΩ | 10 | | 250 | mA |
| V _{DO(IN-OUT)} | Drop-Out, VIN – VOUT | Adjust V _{IN} down until I _{OUT} = 0.2 A; V _{OUT} = 4.15 V; R _{ISET} = 680 Ω; T _J ≤ 100°C | | 240 | 400 | mV |
| I _{OUT} | Output “fast charge” formula | V _{OUT(REG)} > V _{OUT} > V _{LOWV} ; V _{IN} = 5 V | K _{ISET} /R _{ISET} | | | A |
| K _{ISET} | Fast charge current factor | R _{ISET} = K _{ISET} /I _{OUT} ; 20 < I _{OUT} < 250 mA | 129 | 135 | 145 | AΩ |
| | | R _{ISET} = K _{ISET} /I _{OUT} ; 5 < I _{OUT} < 20 mA | 125 | 135 | 145 | |
| PRECHARGE – SET BY PRETERM PIN | | | | | | |
| V _{LOWV} | Pre-charge to fast-charge transition threshold | | 2.4 | 2.5 | 2.6 | V |
| t _{DGL1(LOWV)} | Deglitch time on pre-charge to fast-charge transition | | | 57 | | μs |
| t _{DGL2(LOWV)} | Deglitch time on fast-charge to pre-charge transition | | | 32 | | ms |
| I _{PRE-TERM} | Refer to the Termination Section | | | | | |
| %PRECHG | Pre-charge current, default setting | V _{OUT} < V _{LOWV} ; R _{ISET} = 2.7 kΩ; R _{PRE-TERM} = High Z or for bq25101/101H | 18 | 20 | 22 | %I _{OUT-CC} |
| | Pre-charge current formula | R _{PRE-TERM} = K _{PRE-CHG} (Ω/%) × %PRE-CHG (%) | R _{PRE-TERM} /K _{PRE-CHG} % | | | |
| K _{PRE-CHG} | % Pre-charge Factor | V _{OUT} < V _{LOWV} ; V _{IN} = 5 V; R _{PRE-TERM} = 6 kΩ to 30 kΩ; R _{ISET} = 1.8 kΩ; R _{PRE-TERM} = K _{PRE-CHG} × %I _{PRE-CHG} ; where %I _{PRE-CHG} is 20 to 100% | 280 | 300 | 320 | Ω/% |
| | | V _{OUT} < V _{LOWV} ; V _{IN} = 5 V; R _{PRE-TERM} = 3 kΩ to 6 kΩ; R _{ISET} = 1.8 kΩ; R _{PRE-TERM} = K _{PRE-CHG} × %I _{PRE-CHG} ; where %I _{PRE-CHG} is 10% to 20% | 265 | 305 | 347 | Ω/% |
| TERMINATION – SET BY PRE-TERM PIN | | | | | | |
| %TERM | Termination threshold current, default setting | V _{OUT} > V _{RCH} ; R _{ISET} = 2.7 kΩ; R _{PRE-TERM} = High Z or for bq25101/101H | 9 | 10 | 11 | %I _{OUT-CC} |

8 Detailed Description

8.1 Overview

The bq25100B is a highly integrated family of single cell Li-Ion and Li-Pol chargers. The charger can be used to charge a battery, power a system or both. The charger has three phases of charging: pre-charge to recover a fully discharged battery, fast-charge constant current to supply the charge safely and voltage regulation to safely reach full capacity. The charger is very flexible, allowing programming of the fast-charge current and Pre-charge/Termination Current. This charger is designed to work with a USB connection (100-mA limit) or Adaptor (DC output). The charger also checks to see if a battery is present. The following discussion reviews all products in the bq25100B family. Not all features apply to the bq25100B.

The charger also comes with a full set of safety features: JEITA Temperature Standard (bq25100/01/100H/101H), Over-Voltage Protection, DPM-IN, Safety Timers, and ISET short protection. All of these features and more are described in detail below.

The charger is designed for a single power path from the input to the output to charge a single cell Li-Ion or Li-Pol battery pack. Upon application of a 5-V DC power source the ISET and OUT short checks are performed to assure a proper charge cycle.

If the battery voltage is below the LOWV threshold, the battery is considered discharged and a preconditioning cycle begins. The amount of precharge current can be programmed using the PRE-TERM pin which programs a percent of fast charge current (10 to 100%) as the precharge current. This feature is useful when the system load is connected across the battery “stealing” the battery current. The precharge current can be set higher to account for the system loading while allowing the battery to be properly conditioned. The PRE-TERM pin is a dual function pin which sets the precharge current level and the termination threshold level. The termination “current threshold” is always half of the precharge programmed current level.

Once the battery voltage has charged to the VLOWV threshold, fast charge is initiated and the fast charge current is applied. The fast charge constant current is programmed using the ISET pin. The constant current provides the bulk of the charge. Power dissipation in the IC is greatest in fast charge with a lower battery voltage. If the IC reaches 125°C, the IC enters thermal regulation, slows the timer clock by half, and reduces the charge current as needed to keep the temperature from rising any further. [Figure 17](#) shows the charging profile with thermal regulation. Typically under normal operating conditions, the IC’s junction temperature is less than 125°C and thermal regulation is not entered.

Once the cell has charged to the regulation voltage the voltage loop takes control and holds the battery at the regulation voltage until the current tapers to the termination threshold. The termination can be disabled if desired.

Further details are described in the Operating Modes section.

Overview (continued)

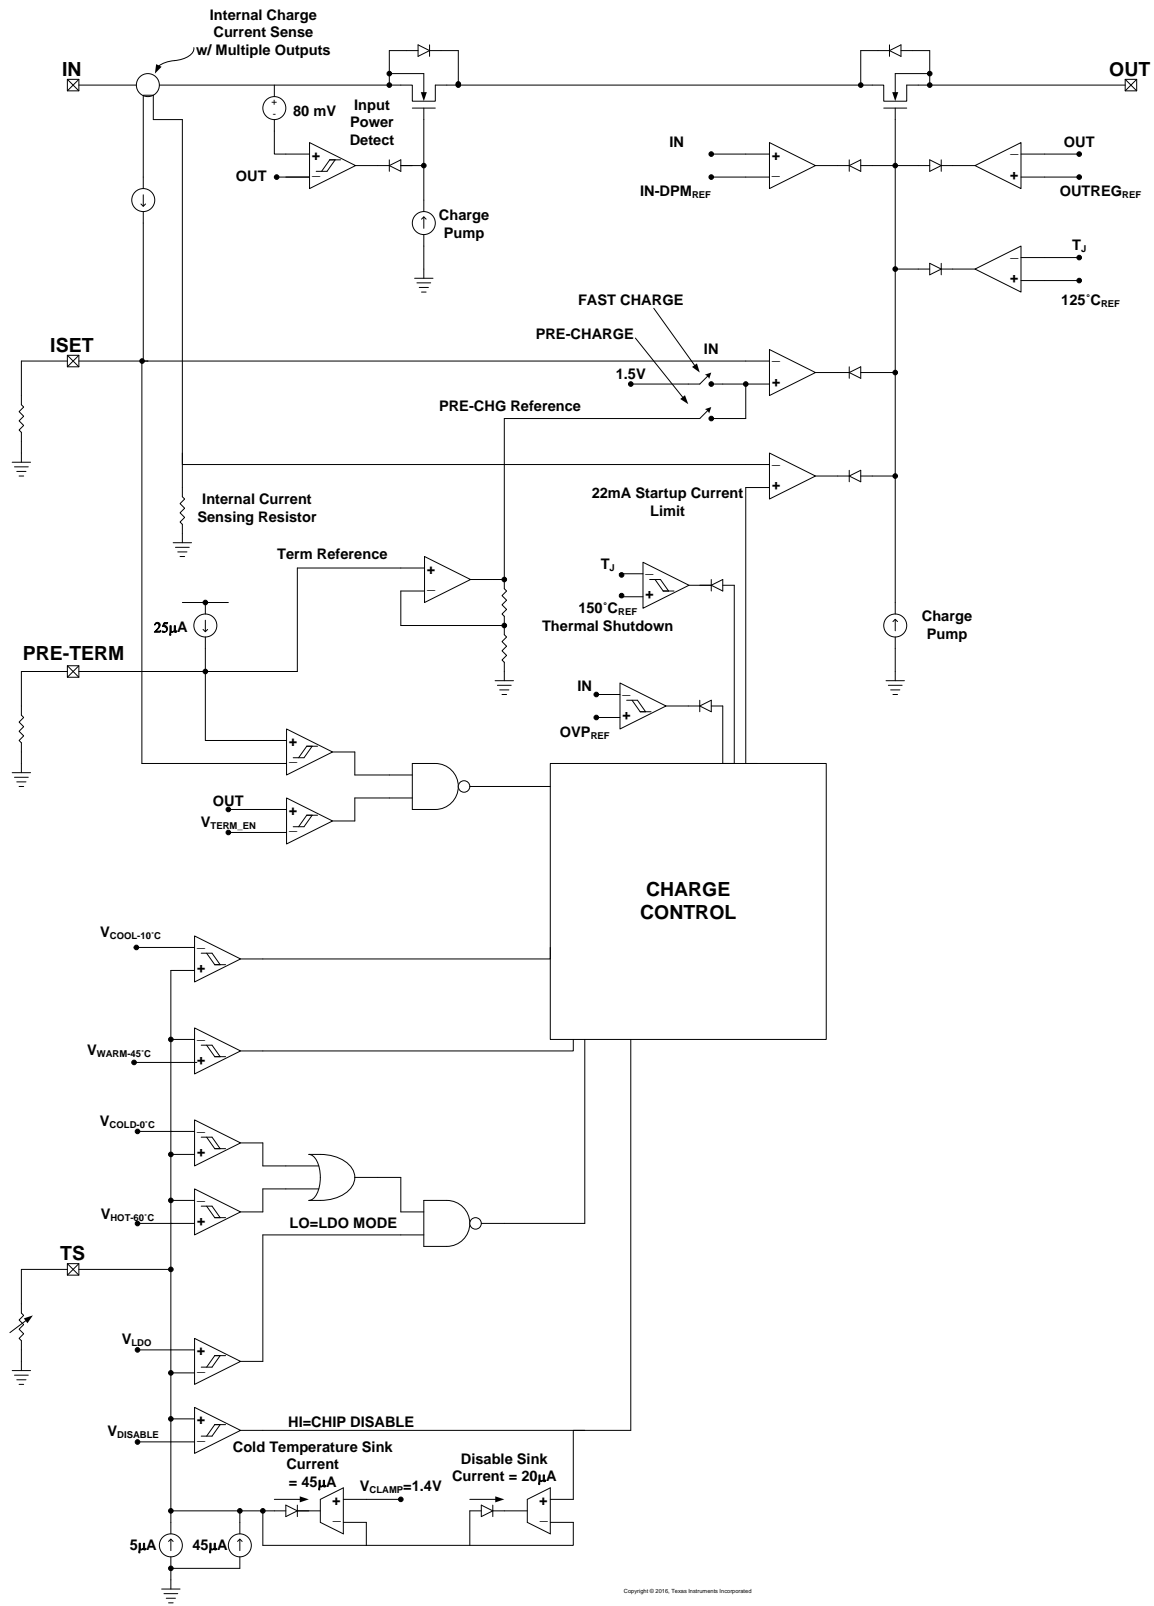

Figure 17. Charging Profile With Thermal Regulation

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Overvoltage-Protection (OVP) – Continuously Monitored

If the input source applies an overvoltage, the pass FET, if previously on, turns off after a deglitch, $t_{BLK(OVP)}$. The timer stops counting. Once the overvoltage returns to a normal voltage, the timer and charge continues.

8.3.2 \overline{CHG} Pin Indication (bq25101, bq25101H)

The charge pin has an internal open drain FET which is on (pulls down to VSS) during the first charge only (independent of TTDM) and is turned off once the battery reaches voltage regulation and the charge current tapers to the termination threshold set by the PRE-TERM resistor. The bq25101/01H terminates at 10% of the programmed charge current. The charge pin is high impedance in sleep mode and OVP and returns to its previous state once the condition is removed. Cycling input power, removing and replacing the battery, pulling the TS pin low and releasing or entering pre-charge mode causes the \overline{CHG} pin to go reset (go low if power is good and a discharged battery is attached) and is considered the start of a first charge.

8.3.3 \overline{CHG} Pin LED Pull-up Source (bq25101, bq25101H)

For host monitoring, a pull-up resistor is used between the \overline{CHG} pin and the VCC of the host and for a visual indication a resistor in series with an LED is connected between the \overline{CHG} pin and a power source. If the CHG source is capable of exceeding 7 V, a 6.2-V zener should be used to clamp the voltage. If the source is the OUT pin, note that as the battery changes voltage, and the brightness of the LEDs vary.

8.3.4 IN-DPM (V_{IN-DPM} or IN-DPM)

The IN-DPM feature is used to detect an input source voltage that is folding back (voltage dropping), reaching its current limit due to excessive load. When the input voltage drops to the V_{IN-DPM} threshold the internal pass FET starts to reduce the current until there is no further drop in voltage at the input. This would prevent a source with voltage less than V_{IN-DPM} to power the out pin. This is an added safety feature that helps protect the source from excessive loads. This feature is not applicable for bq25100B.

8.3.5 OUT

The Charger's OUT pin provides current to the battery and to the system, if present. This IC can be used to charge the battery plus power the system, charge just the battery or just power the system (TTDM) assuming the loads do not exceed the available current. The OUT pin is a current limited source and is inherently protected against shorts. If the system load ever exceeds the output programmed current threshold, the output will be discharged unless there is sufficient capacitance or a charged battery present to supplement the excessive load.

8.3.6 ISET

An external resistor is used to Program the Output Current (10 to 250 mA) and can be used as a current monitor.

$$R_{ISET} = K_{ISET} \div I_{OUT} \quad (1)$$

Where:

I_{OUT} is the desired fast charge current;

K_{ISET} is a gain factor found in the electrical specification

For greater accuracy at lower currents, part of the sense FET is disabled to give better resolution. Going from higher currents to low currents, there is hysteresis and the transition occurs around 50 mA.

The ISET resistor is short protected and will detect a resistance lower than $\approx 420 \Omega$. The detection requires at least 50 mA of output current. If a "short" is detected, then the IC will latch off and can be reset by cycling the power or cycling TS pin. The OUT current is internally clamped to a maximum current of 600 mA typical and is independent of the ISET short detection circuitry.

For charge current that is below 50 mA, an extra RC circuit is recommended on ISET to achieve more stable current signal. More detail is available in 9.1 Application Information.

Feature Description (continued)

Feature Description (continued)

Figure 19. Standard Operation Over TS Bias Voltage – bq25100B, bq25100A, bq25100L

8.3.7 PRE_TERM – Pre-Charge and Termination Programmable Threshold

Pre-Term is used to program both the pre-charge current and the termination current threshold. The pre-charge current level is a factor of two higher than the termination current level. The termination can be set between 5 and 50% (recommended range) of the programmed output current level set by ISET. If left floating the termination and pre-charge are set internally at 10/20% respectively. The $R_{PRE-TERM}$ is ranged from 600 Ω to 30 k Ω and the minimum termination current can be programmed to 1 mA. The pre-charge-to-fast-charge, V_{lowv} threshold is set to 2.5 V.

$$R_{PRE-TERM} = \%Term \times K_{TERM} = \%Pre-CHG \times K_{PRE-CHG} \quad (2)$$

Where:

%Term is the percent of fast charge current where termination occurs;

%Pre-CHG is the percent of fast charge current that is desired during precharge;

K_{TERM} and $K_{PRE-CHG}$ are gain factors found in the electrical specifications.

8.3.8 TS

The TS function for the bq25100B/bq25100A cuts the charge current level in half between 0°C and 10°C and disables charging when the NTC temperature is above 45°C. The TS function for the bq25100/bq25100H/bq25101/bq25101H is designed to follow the new JEITA temperature standard for Li-Ion and Li-Pol batteries. There are now four thresholds, 60°C, 45°C, 10°C, and 0°C. Normal operation occurs between 10°C and 45°C. If between 0°C and 10°C the charge current level is cut in half and if between 45°C and 60°C the regulation voltage is reduced to 4.1 V max for bq25100 and 4.2 V max for bq25100H, see Figure 18.

Feature Description (continued)

The TS feature is implemented using an internal 50 μ A current source to bias the thermistor (designed for use with a 10-k NTC $\beta = 3370$ (SEMITEC 103AT-2 or Mitsubishi TH05-3H103F) connected from the TS pin to V_{SS} . If this feature is not needed, a fixed 10-k can be placed between TS and V_{SS} to allow normal operation. This may be done if the host is monitoring the thermistor and then the host would determine when to pull the TS pin low to disable charge.

The TS pin has two additional features, when the TS pin is pulled low or floated/driven high. A low disables charge and a high puts the charger in TTDM.

Above 45°C (60°C for bq25100/bq25100H/bq25101/bq25101H) or below 0°C the charge is disabled. Once the thermistor reaches $\pm 10^\circ\text{C}$ the TS current folds back to keep a cold thermistor (between -10°C and -50°C) from placing the IC in the TTDM mode. If the TS pin is pulled low into disable mode, the current is reduced to $\approx 30\ \mu\text{A}$. Since the I_{TS} current is fixed along with the temperature thresholds, it is not possible to use thermistor values other than the 10-k NTC (at 25°C).

8.3.9 Timers

The pre-charge timer is set to 30 minutes. The pre-charge current, can be programmed to off-set any system load, making sure that the 30 minutes is adequate.

The fast charge timer is fixed at 10 hours and can be increased real time by going into thermal regulation or IN-DPM. The timer clock slows by a factor of 2, resulting in a clock that counts half as fast when in these modes. If either the 30 minute or ten hour timer times out, the charging is terminated and for bq25101/1H the $\overline{\text{CHG}}$ pin goes high impedance if not already in that state. The timer is reset by disabling the IC, cycling power or going into and out of TTDM.

8.3.10 Termination

Once the OUT pin goes above VRCH, (reaches voltage regulation) and the current tapers down to the termination threshold, a battery detect routine is run to determine if the battery was removed or the battery is full. If the battery is present, the charge current will terminate. If the battery was removed along with the thermistor, then the TS pin is driven high and the charge enters TTDM. If the battery was removed and the TS pin is held in the active region, then the battery detect routine will continue until a battery is inserted. The termination current can be programmed down to 625 μA , however, the accuracy will reduce accordingly when the termination current is below 1 mA.

8.4 Device Functional Modes

8.4.1 Power-Down or Undervoltage Lockout (UVLO)

The bq25100B family is in power down mode if the IN pin voltage is less than UVLO. The part is considered "dead" and all the pins are high impedance. Once the IN voltage rises above the UVLO threshold the IC will enter Sleep Mode or Active mode depending on the OUT pin (battery) voltage.

8.4.2 Power-up

The IC is alive after the IN voltage ramps above UVLO (see sleep mode), resets all logic and timers, and starts to perform many of the continuous monitoring routines. Typically the input voltage quickly rises through the UVLO and sleep states where the IC declares power good, starts the qualification charge at 22 mA, sets the charge current base on the ISET pin, and starts the safety timer.

8.4.3 Sleep Mode

If the IN pin voltage is between $V_{OUT} + V_{DT}$ and UVLO, the charge current is disabled, the safety timer counting stops (not reset). As the input voltage rises and the charger exits sleep mode, the safety timer continues to count and the charge is enabled. See [Figure 20](#).

8.4.4 New Charge Cycle

A new charge cycle is started when a good power source is applied, performing a chip disable/enable (TS pin), exiting Termination and Timer Disable Mode (TTDM), detecting a battery insertion or the OUT voltage dropping below the VRCH threshold.

Device Functional Modes (continued)

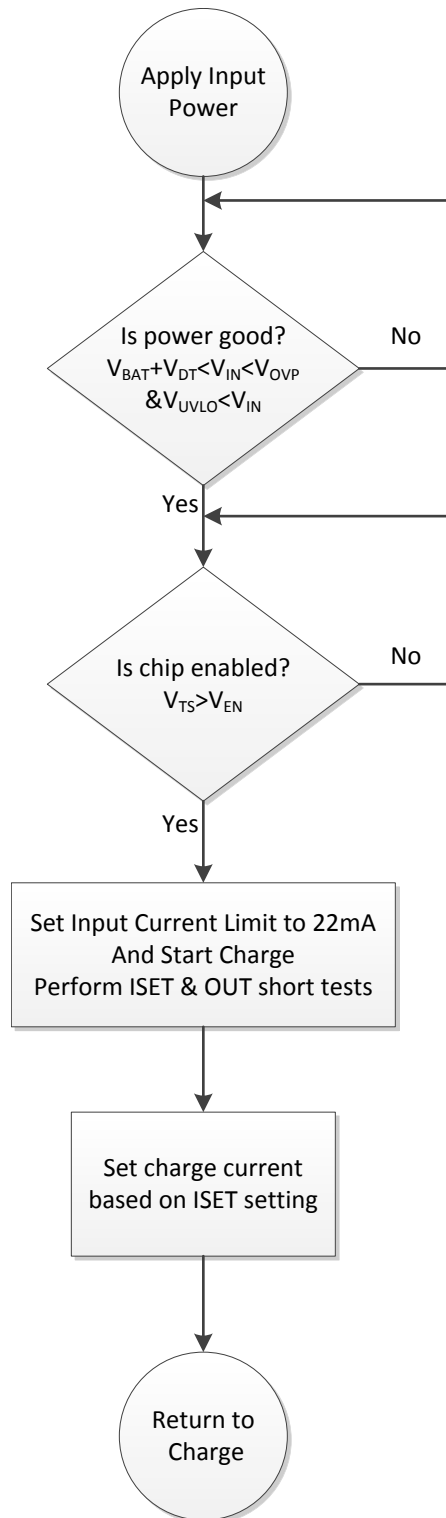

Figure 20. bq25100B Power-Up Flow Diagram

Device Functional Modes (continued)

8.4.5 Termination and Timer Disable Mode (TTDM) - TS Pin High

The battery charger is in TTDM when the TS pin goes high from removing the thermistor (removing battery pack/floating the TS pin) or by pulling the TS pin up to the TTDM threshold.

When entering TTDM, the 10 hour safety timer is held in reset and termination is disabled. A battery detect routine is run to see if the battery was removed or not. For bq25101/1H, if the battery was removed then the $\overline{\text{CHG}}$ pin will go to its high impedance state if not already there. If a battery is detected the $\overline{\text{CHG}}$ pin does not change states until the current tapers to the termination threshold, where the $\overline{\text{CHG}}$ pin goes to its high impedance state if not already there (the regulated output will remain on).

The charging profile does not change (still has pre-charge, fast-charge constant current and constant voltage modes). This implies the battery is still charged safely and the current is allowed to taper to zero.

When coming out of TTDM, the battery detect routine is run and if a battery is detected, then a new charge cycle begins.

If TTDM is not desired upon removing the battery with the thermistor, one can add a 237-k Ω resistor between TS and V_{SS} to disable TTDM. This keeps the current source from driving the TS pin into TTDM. This creates $\pm 0.1^{\circ}\text{C}$ error at hot and a $\pm 3^{\circ}\text{C}$ error at cold.

8.4.6 Battery Detect Routine

The battery detect routine should check for a missing battery while keeping the OUT pin at a useable voltage.

The battery detect routine is run when entering and exiting TTDM to verify if battery is present, or run all the time if battery is missing and not in TTDM. On power-up, if battery voltage is greater than V_{RCH} threshold, a battery detect routine is run to determine if a battery is present.

The battery detect routine is disabled while the IC is in TTDM, or has a TS fault. See [Figure 21](#) for the Battery Detect Flow Diagram.

8.4.7 Refresh Threshold

After termination, if the OUT pin voltage drops to V_{RCH} (100mV below regulation) then a new charge is initiated.

8.4.8 Starting a Charge on a Full Battery

The termination threshold is raised by $\pm 14\%$ for the first minute of a charge cycle so if a full battery is removed and reinserted or a new charge cycle is initiated, that the new charge terminates (less than 1 minute). Batteries that have relaxed many hours may take several minutes to taper to the termination threshold and terminate charge.

Device Functional Modes (continued)

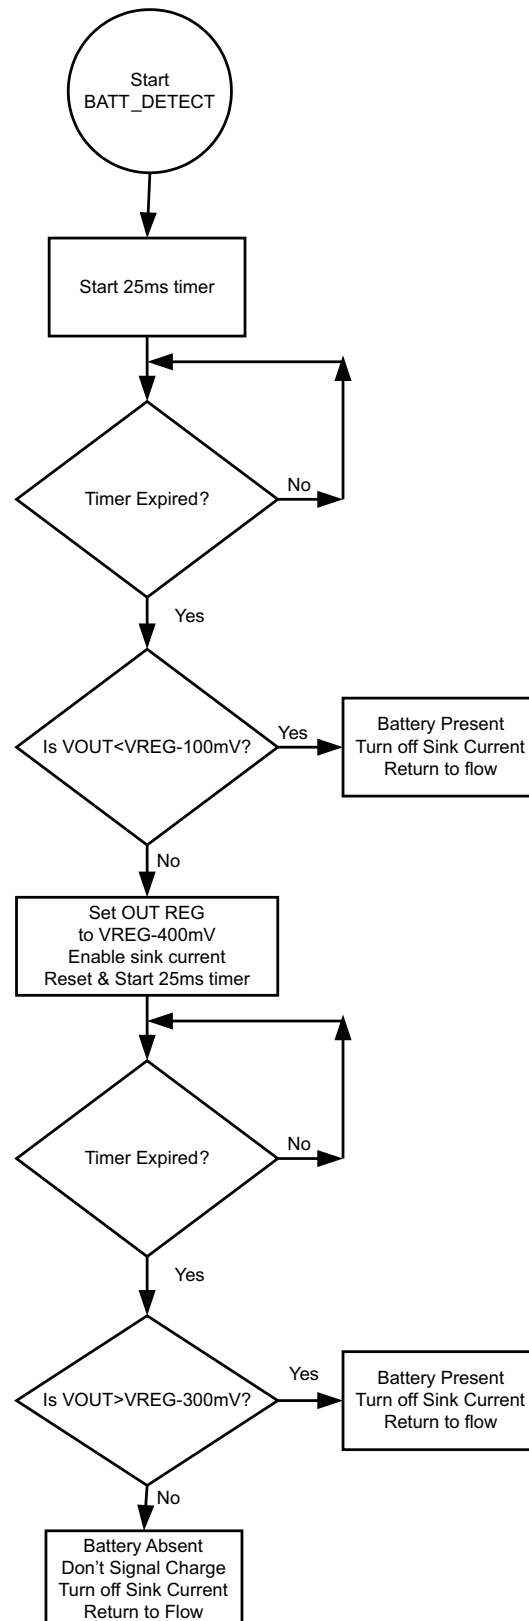

Figure 21. Battery Detect Routine

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The bq25100B series of devices are highly integrated Li-Ion and Li-Pol linear chargers targeted at space-limited portable applications. The fast charge current can be programmed from 10 mA to 250 mA through an external resistor on ISET pin. The pre_charge and termination current can also be programmed through the resistor connected on PRETERM pin. The device has complete system-level protection such as input under-voltage lockout (UVLO), input over-voltage protection (OVP), sleep mode, thermal regulation, safety timers, and NTC monitoring input.

9.2 Typical Application

This typical application shows a charger application design example.

Copyright © 2016, Texas Instruments Incorporated

9.2.1 Design Requirements

- Supply voltage = 5 V
- Fast charge current: $I_{OUT-FC} = 40 \text{ mA}$;
- Termination Current Threshold: $\%I_{OUT-FC} = 10\%$ of Fast Charge or $\sim 4 \text{ mA}$
- Pre-Charge Current by default is twice the termination Current or $\sim 8 \text{ mA}$
- TS – Battery Temperature Sense = 10-k NTC (103AT)
- CE is an open drain control pin

Typical Application (continued)

9.2.2 Detailed Design Procedures

- The regulation voltage is set to 4.2 V, the input voltage is 5 V and the charge current is programmed to 40 mA.
- For charge current that is below 50 mA, an extra RC circuit is recommended on ISET to achieve more stable current signal. For applications that need higher charge current, the RC circuit is not needed.
- For applications that use more than 200-mA current, there could be a very low level ~1% of charge current ringing in the output. The ringing can be removed by increasing the input capacitance.

9.2.2.1 Calculations

9.2.2.1.1 Program the Fast Charge Current, ISET:

$$R_{ISET} = [K_{(ISET)} / I_{(OUT)}]$$

from electrical characteristics table. . . $K_{(SET)} = 135 \text{ A}\Omega$

$$R_{ISET} = [135 \text{ A}\Omega / 0.04 \text{ A}] = 3.4 \text{ k}\Omega$$

Selecting the closest standard value, use a 3.4-k Ω resistor between ISET and Vss.

9.2.2.1.2 Program the Termination Current Threshold, ITERM:

$$R_{PRE-TERM} = K_{(TERM)} \times \%I_{OUT-FC}$$

$$R_{PRE-TERM} = 600 \text{ }\Omega/\% \times 10\% = 6 \text{ k}\Omega$$

Selecting the closest standard value, use a 6-k Ω resistor between PRETERM and Vss.

One can arrive at the same value by using 20% for a pre-charge value (factor of 2 difference).

$$R_{PRE-TERM} = K_{(PRE-CHG)} \times \%I_{OUT-FC}$$

$$R_{PRE-TERM} = 300 \text{ }\Omega/\% \times 20\% = 6 \text{ k}\Omega$$

9.2.2.1.3 TS Function

Use a 10-k NTC thermistor in the battery pack (103AT).

To Disable the temp sense function, use a fixed 10-k Ω resistor between the TS and VSS.

9.2.2.1.4 Selecting IN and OUT Pin Capacitors

In most applications, all that is needed is a high-frequency decoupling capacitor (ceramic) on the power pin, input and output pins. Using the values shown on the application diagram is recommended. After evaluation of these voltage signals with real system operational conditions, one can determine if capacitance values can be adjusted toward the minimum recommended values (DC load application) or higher values for fast, high amplitude, pulsed load applications. Note if designed for high input voltage sources (bad adaptors or wrong adaptors), the capacitor needs to be rated appropriately. Ceramic capacitors are tested to 2x their rated values so a 16-V capacitor may be adequate for a 30-V transient (verify tested rating with capacitor manufacturer).

10 Power Supply Recommendations

10.1 Leakage Current Effects on Battery Capacity

To determine how fast a leakage current on the battery will discharge the battery is an easy calculation. The time from full to discharge can be calculated by dividing the Amp-Hour Capacity of the battery by the leakage current. For a 0.1-AHr battery and a 75-nA leakage current ($100 \text{ mAHr} / 75 \text{ nA} = 250000 \text{ Hours}$), it would take 1333k hours or 152 years to discharge. In reality the self discharge of the cell would be much faster so the 75-nA leakage would be considered negligible.

11 Layout

11.1 Layout Guidelines

To obtain optimal performance, the decoupling capacitor from IN to GND and the output filter capacitors from OUT to GND should be placed as close as possible to the bq25100B, with short trace runs to both IN, OUT and GND.

- All low-current GND connections should be kept separate from the high-current charge or discharge paths from the battery. Use a single-point ground technique incorporating both the small signal ground path and the power ground path.
- The high current charge paths into IN pin and from the OUT pin must be sized appropriately for the maximum charge current in order to avoid voltage drops in these traces

11.2 Layout Example

Figure 26. Board Layout

11.3 Thermal Considerations

The most common measure of package thermal performance is thermal impedance (θ_{JA}) measured (or modeled) from the chip junction to the air surrounding the package surface (ambient). The mathematical expression for θ_{JA} is:

$$R_{\theta JA} = (T_J - T_A) / P$$

where

- T_J = chip junction temperature
- T_A = Ambient temperature
- P = device power dissipation

(3)

Factors that can influence the measurement and calculation of $R_{\theta JA}$ include:

1. Whether or not the device is board mounted
2. Trace size, composition, thickness, and geometry
3. Orientation of the device (horizontal or vertical)
4. Volume of the ambient air surrounding the device under test and airflow
5. Whether other surfaces are in close proximity to the device being tested

Due to the charge profile of Li-Ion and Li-Pol batteries the maximum power dissipation is typically seen at the beginning of the charge cycle when the battery voltage is at its lowest. Typically after fast charge begins the pack voltage increases to ≈ 3.4 V within the first 2 minutes. The thermal time constant of the assembly typically takes a few minutes to heat up so when doing maximum power dissipation calculations, 3.4 V is a good minimum voltage to use.

The device power dissipation, P , is a function of the charge rate and the voltage drop across the internal PowerFET. It can be calculated from the following equation when a battery pack is being charged :

$$P = [V_{(IN)} - V_{(OUT)}] \times I_{(OUT)} \quad (4)$$

The thermal loop feature reduces the charge current to limit excessive IC junction temperature. It is recommended that the design not run in thermal regulation for typical operating conditions (nominal input voltage and nominal ambient temperatures) and use the feature for non typical situations such as hot environments or higher than normal input source voltage. With that said, the IC will still perform as described, if the thermal loop is always active.

12 Device and Documentation Support

12.1 Device Support

12.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

12.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

Table 1. Related Links

| PARTS | PRODUCT FOLDER | SAMPLE & BUY | TECHNICAL DOCUMENTS | TOOLS & SOFTWARE | SUPPORT & COMMUNITY |

12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.5 Trademarks

E2E is a trademark of Texas Instruments.

Bluetooth is a registered trademark of Bluetooth SIG, Inc..

12.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|--------------------|------|----------------|----------------------------|-------------------------|----------------------|--------------|-------------------------|-------------------------|
| BQ25100BYFPR | ACTIVE | DSBGA | YFP | 6 | 3000 | Green (RoHS & no Sb/Br) | SNAGCU | Level-1-260C-UNLIM | -5 to 125 | 25100B | Samples |
| BQ25100BYFPT | ACTIVE | DSBGA | YFP | 6 | 250 | Green (RoHS & no Sb/Br) | SNAGCU | Level-1-260C-UNLIM | -5 to 125 | 25100B | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
