

INA20x Unidirectional Measurement Current-Shunt Monitor With Dual Comparators

1 Features

- Complete Current Sense Solution
- Three Gain Options Available:
 - INA206 = 20 V/V
 - INA207 = 50 V/V
 - INA208 = 100 V/V
- Dual Comparators:
 - Comparator 1 With Latch
 - Comparator 2 With Optional Delay
- Common-mode Range: –16 V to 80 V
- High Accuracy: 3.5% (Maximum) Over Temperature
- Bandwidth: 500 kHz
- Quiescent Current: 1.8 mA
- Packages: SO-14, TSSOP-14, VSSOP-10

2 Applications

- Notebook Computers
- Cell Phones
- Telecom Equipment
- Automotive
- Power Management
- Battery Chargers
- Welding Equipment

3 Description

The INA206, INA207, and INA208 are a family of unidirectional current-shunt monitors with voltage output, dual comparators, and voltage reference. The INA206, INA207, and INA208 can sense drops across shunts at a common-mode voltages from –16 V to 80 V. The INA206, INA207, and INA208 are available with three output voltage scales: 20 V/V, 50 V/V, and 100 V/V, with up to 500-kHz bandwidth.

The INA206, INA207, and INA208 also incorporates two open-drain comparators with internal 0.6-V references. On 14-pin versions, the comparator references can be overridden by external inputs. Comparator 1 includes a latching capability, and Comparator 2 has a user-programmable delay on 14-pin versions. The 14-pin versions also provide a 1.2 V reference output.

The INA206, INA207, and INA208 operate from a single 2.7-V to 18-V supply. They are specified over the extended operating temperature range of –40°C to 125°C.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA206	SOIC (14)	8.65 mm x 3.91 mm
INA207	TSSOP (14)	5.00 mm x 4.40 mm
INA208	VSSOP (10)	3.00 mm x 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Device Comparison Table

DEVICE	GAIN
INA206	20 V/V
INA207	50 V/V
INA208	100 V/V

6 Pin Configuration and Functions

Pin Functions: SOIC and TSSOP

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V _s	I	Power Supply
2	OUT	O	Output voltage
3	CMP1 IN- /0.6V Ref	I	Comparator 1 negative input, can be used to override the internal 0.6-V reference
4	CMP1 IN+	I	Comparator 1 positive input
5	CMP2 IN-	I	Comparator 2 negative input
6	CMP2 IN+ /0.6V Ref	I	Comparator 2 positive input, can be used to override the internal 0.6-V reference
7	GND	I	Ground
8	<u>CMP1</u> RESET	I	Comparator 1 output reset, active low
9	CMP2 DELAY	I	Connect an optional capacitor to adjust comparator 2 delay
10	CMP2 OUT	O	Comparator 2 output
11	CMP1 OUT	O	Comparator 1 output
12	1.2V REF OUT	O	1.2-V reference output
13	V _{IN-}	I	Connect to shunt low side
14	V _{IN+}	I	Connect to shunt high side

Pin Functions: VSSOP

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V _s	I	Power Supply
2	OUT	O	Output voltage
3	CMP1 IN+	I	Comparator 1 positive input
4	CMP2 IN-	I	Comparator 2 negative input
5	GND	I	Ground
6	<u>CMP1 RESET</u>	I	Comparator 1 output reset, active low
7	CMP2 OUT	O	Comparator 2 output
8	CMP1 OUT	O	Comparator 1 output
9	V _{IN-}	I	Connect to shunt low side
10	V _{IN+}	I	Connect to shunt high side

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V_s			18	V
Current-shunt monitor analog inputs, V_{IN+} and V_{IN-}	Differential ($V_{IN+} - V_{IN-}$)	-18	18	V
	Common-Mode	-16	80	V
Comparator analog input and reset pins		GND - 0.3	$(V_s) + 0.3$	V
Analog output, out pin		GND - 0.3	$(V_s) + 0.3$	V
Comparator output, out pin		GND - 0.3	18	V
V_{REF} and CMP2 delay pin		GND - 0.3	10	V
Input current into any pin			5	mA
Operating temperature		-55	150	°C
Junction temperature		-65	150	°C
Storage temperature, T_{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
V_{cm} Common-mode input voltage	-16	12	80	V
V_s Operating supply voltage	2.7	12	18	V
T_A Operating free-air temperature	-40	25	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		INA20x			UNIT
		D (SOIC)	DGS (VSSOP)	PW (TSSOP)	
		14 PINS	10 PINS	14 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	84.9	161.3	112.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	44	36.8	37.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	39.4	82.3	55.4	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	10.3	1.3	2.7	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	39.1	80.8	54.7	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	150	200	150	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Electrical Characteristics: Current-Shunt Monitor

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{IN+} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ each connected from CMP1 OUT and CMP2 OUT to V_S , and CMP1 IN+ = 1 V and CMP2 IN- = GND, unless otherwise noted.

PARAMETERS		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT						
V_{SENSE}	Full-scale sense input voltage	$V_{SENSE} = V_{IN+} - V_{IN-}$		0.15	$(V_S - 0.25)/\text{Gain}$	V
V_{CM}	Common-mode input range	$T_A = -40^\circ\text{C}$ to 125°C	-16		80	V
CMRR	Common-mode rejection ratio	$V_{IN+} = -16\text{ V}$ to 80 V	80	100		dB
	Common-mode rejection ratio over temperature	$V_{IN+} = 12\text{ V}$ to 80 V , $T_A = -40^\circ\text{C}$ to 125°C	100		123	dB
V_{OS}	Offset voltage RTI ⁽¹⁾	$T_A = 25^\circ\text{C}$		± 0.5	± 2.5	mV
		$T_A = 25^\circ\text{C}$ to 125°C			± 3	
		$T_A = -40^\circ\text{C}$ to 25°C			± 3.5	
dV_{OS}/dT	Offset voltage RTI vs temperature	$T_A = -40^\circ\text{C}$ to 125°C		5		$\mu\text{V}/^\circ\text{C}$
PSR	Offset voltage RTI vs power supply	$V_{OUT} = 2\text{ V}$, $V_{IN+} = 18\text{ V}$, 2.7 V , $T_A = -40^\circ\text{C}$ to 125°C		2.5	100	$\mu\text{V}/\text{V}$
I_B	Input bias current, V_{IN-} -Pin	$T_A = -40^\circ\text{C}$ to 125°C		± 9	± 16	μA
OUTPUT ($V_{SENSE} \geq 20\text{ mV}$)						
G	Gain	INA206		20		V/V
		INA207		50		
		INA208		100		
	Gain error	$V_{SENSE} = 20\text{ mV}$ to 100 mV		$\pm 0.2\%$	$\pm 1\%$	
	Gain error over temperature	$V_{SENSE} = 20\text{ mV}$ to 100 mV , $T_A = -40^\circ\text{C}$ to 125°C			$\pm 2\%$	
	Total output error ⁽²⁾	$V_{SENSE} = 120\text{ mV}$, $V_S = 16\text{ V}$		$\pm 0.75\%$	$\pm 2.2\%$	
	Total output error over temperature	$V_{SENSE} = 120\text{ mV}$, $V_S = 16\text{ V}$, $T_A = -40^\circ\text{C}$ to 125°C			$\pm 3.5\%$	
	Nonlinearity error ⁽³⁾	$V_{SENSE} = 20\text{ mV}$ to 100 mV		$\pm 0.002\%$		
R_O	Output impedance			1.5		Ω
	Maximum capacitive load	No Sustained Oscillation		10		nF
OUTPUT ($V_{SENSE} < 20\text{ mV}$) ⁽⁴⁾						
Output voltage	Output voltage	INA206	$-16\text{ V} \leq V_{CM} < 0\text{ V}$	300		mV
		INA207		300		
		INA208		300		
	INA206	$0\text{ V} \leq V_{CM} \leq V_S$, $V_S = 5\text{ V}$		0.4	V	
	INA207			1		
	INA208			2		
	INA206	$V_S < V_{CM} \leq 80\text{ V}$		300	mV	
	INA207			300		
	INA208			300		
VOLTAGE OUTPUT						
	Output swing to the positive rail	$V_{IN-} = 11\text{ V}$, $V_{IN+} = 12\text{ V}$, $T_A = -40^\circ\text{C}$ to 125°C		$(V_S) - 0.15$	$(V_S) - 0.25$	V
	Output swing to GND ⁽⁵⁾	$V_{IN-} = 0\text{ V}$, $V_{IN+} = -0.5\text{ V}$, $T_A = -40^\circ\text{C}$ to 125°C		$(V_{GND}) + 0.004$	$(V_{GND}) + 0.05$	V

(1) Offset is extrapolated from measurements of the output at 20 mV and 100 mV V_{SENSE} .

(2) Total output error includes effects of gain error and V_{OS} .

(3) Linearity is best fit to a straight line.

(4) For details on this region of operation, see the [Accuracy Variations as a Result of \$V_{SENSE}\$ and Common-Mode Voltage](#) section.

(5) Specified by design.

Electrical Characteristics: Current-Shunt Monitor (continued)

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{IN+} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ each connected from CMP1 OUT and CMP2 OUT to V_S , and CMP1 IN+ = 1 V and CMP2 IN– = GND, unless otherwise noted.

PARAMETERS	TEST CONDITIONS	MIN	TYP	MAX	UNIT
FREQUENCY RESPONSE

CMP1 IN+, CMP2 IN– vs Temperature	$T_A = -40^\circ\text{C}$ to 125°C			15	nA
INPUT IMPEDANCE					
Pins 3 and 6 (14-pin packages only)			10		k Ω
INPUT RANGE					
CMP1 IN+ and CMP2 IN–		0 V to $V_S - 1.5\text{ V}$			V
Pins 3 and 6 (14-pin packages only) (3)		0 V to $V_S - 1.5\text{ V}$			V
OUTPUT					
Large-signal differential voltage gain	CMP V_{OUT} 1 V to 4 V, $R_L \geq 15\text{ k}\Omega$ connected to 5 V		200		V/mV
High-level output current	$V_{ID} = 0.4\text{ V}$, $V_{OH} = V_S$		0.0001	1	μA
Low-level output voltage	$V_{ID} = -0.6\text{ V}$, $I_{OL} = 2.35\text{ mA}$		220	300	mV
RESPONSE TIME ⁽³⁾					
Comparator 1	R_L to 5 V, $C_L = 15\text{ pF}$, 100-mV Input Step with 5-mV Overdrive		1.3		μs
Comparator 2	R_L to 5 V, $C_L = 15\text{ pF}$, 100-mV Input Step with 5-mV Overdrive, C_{DELAY} Pin Open		1.3		μs
RESET					
RESET Threshold ⁽⁴⁾			1.1		V
Logic Input Impedance			2		m Ω
Minimum RESET Pulse Width			1.5		μs
RESET Propagation Delay			3		μs

(1) Hysteresis refers to the threshold (the threshold specification applies to a rising edge of a noninverting input) of a falling edge on the noninverting input of the comparator. See [Figure 1](#).

(2) Specified by design.

(3) The comparator response time specified is the interval between the input step function and the instant when the output crosses 1.4 V.

(4) RESET input has an internal 2 M Ω (typical) pull-down. Leaving RESET open results in a LOW state, with transparent comparator operation.

Electrical Characteristics: Comparator (continued)

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{IN+} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ each connected from CMP1 OUT and CMP2 OUT to V_S , unless otherwise noted.

PARAMETERS	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Comparator 2 Delay Equation ⁽⁵⁾			$C_{DELAY} = t_D/5$		μF
Comparator 2 Delay, t_D	$C_{DELAY} = 0.1\text{ }\mu\text{F}$		0.5		s

(5) The Comparator 2 delay applies to both rising and falling edges of the comparator output.

7.7 Electrical Characteristics: Reference

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{IN+} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ each connected from CMP1 OUT and CMP2 OUT to V_S , unless otherwise noted.

PARAMETERS	TEST CONDITIONS	MIN	TYP	MAX	UNIT
REFERENCE VOLTAGE					
1.2 V_{REFOUT} Output Voltage		1.188	1.2	1.212	V

Reference Output Maximum Capacitive Load	No Sustained Oscillations		10		nF
OUTPUT IMPEDANCE					
Pins 3 and 6 of 14-Pin Packages Only			10		k Ω

7.8 Electrical Characteristics: General

At $T_A = 25^\circ\text{C}$, $V_S = 12\text{ V}$, $V_{IN+} = 12\text{ V}$, $V_{SENSE} = 100\text{ mV}$, $R_L = 10\text{ k}\Omega$ to GND, $R_{PULL-UP} = 5.1\text{ k}\Omega$ each connected from CMP1 OUT and CMP2 OUT to V_S , and CMP1 IN+ = 1 V and CMP2 IN- = GND, unless otherwise noted.

PARAMETERS	TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY					
V_S Operating Power Supply	$T_A = -40^\circ\text{C}$ to 125°C	2.7		18	V
I_Q Quiescent Current	$V_{OUT} = 2\text{ V}$		1.8	2.2	mA
	$V_{SENSE} = 0\text{ mV}$, $T_A = -40^\circ\text{C}$ to 125°C			2.8	mA
Comparator Power-On Reset Threshold ⁽¹⁾			1.5		V
TEMPERATURE					
Specified Temperature Range		-40		125	$^\circ\text{C}$
Operating Temperature Range		-55		150	$^\circ\text{C}$
Storage Temperature Range		-65		150	$^\circ\text{C}$
θ_{JA} Thermal Resistance	MSOP-10 Surface-Mount		200		$^\circ\text{C}/\text{W}$
	SO-14, TSSOP-14 Surface-Mount		150		$^\circ\text{C}/\text{W}$

(1) The INA206, INA207, and INA208 are designed to power-up with the comparator in a defined reset state as long as CMP1 $\overline{\text{RESET}}$ is open or grounded. The comparator will be in reset as long as the power supply is below the voltage shown here. The comparator will assume a state based on the comparator input above this supply voltage. If CMP1 $\overline{\text{RESET}}$ is high at power-up, the comparator output comes up high and requires a reset to assume a low state, if appropriate.

8 Detailed Description

8.1 Overview

The INA206, INA207, and INA208 are a family of unidirectional current-shunt monitors with voltage output, dual comparators, and voltage reference. The INA206, INA207, and INA208 can sense drops across shunts at common-mode voltages from -16 V to 80 V . The INA206, INA207, and INA208 are available with three output voltage scales: 20 V/V , 50 V/V , and 100 V/V , with up to 500-kHz bandwidth. The INA206, INA207, and INA208 also incorporate two open-drain comparators with internal 0.6-V references. On 14-pin versions, the comparator references can be overridden by external inputs. Comparator 1 includes a latching capability, and Comparator 2 has a user-programmable delay. 14-pin versions also provide a 1.2-V reference output. The INA206, INA207, and INA208 operate from a single 2.7-V to 18-V supply. They are specified over the extended operating temperature range of -40°C to 125°C .

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Output Voltage Range

The output of the INA206, INA207, and INA208 is accurate within the output voltage swing range set by the power supply pin, V_S . This performance is best illustrated when using the INA208 (a gain of 100 version), where a 100-mV full-scale input from the shunt resistor requires an output voltage swing of 10 V , and a power-supply voltage sufficient to achieve 10 V on the output.

8.3.2 Reference

The INA206, INA207, and INA208 include an internal voltage reference that has a load regulation of 0.4 mV/mA (typical), and not more than $100\text{ ppm}/^{\circ}\text{C}$ of drift. Only the 14-pin package allows external access to reference voltages, where voltages of 1.2 V and 0.6 V are both available. Output current versus output voltage is illustrated in [Typical Characteristics](#).

8.3.3 Comparator

The INA206, INA207, and INA208 devices incorporate two open-drain comparators. These comparators typically have 2 mV of offset and a $1.3\text{-}\mu\text{s}$ (typical) response time. The output of Comparator 1 latches and is reset through the CMP1 RESET pin, as shown in [Figure 31](#). This configuration applies to both the 10- and 14-pin versions. [Figure 30](#) illustrates the comparator delay.

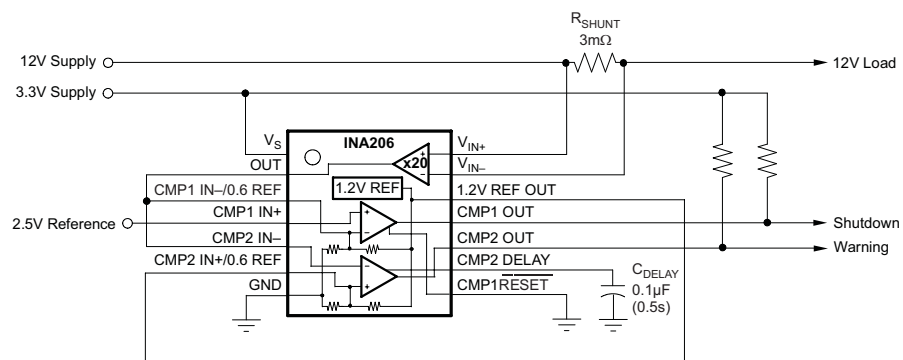

The 14-pin versions of the INA206, INA207, and INA208 include additional features for comparator functions. The comparator reference voltage of both Comparator 1 and Comparator 2 can be overridden by external inputs for increased design flexibility. Comparator 2 has a programmable delay.

Feature Description (continued)

Figure 30. Simplified Model of the Comparator 2 Delay Circuit

Figure 31. Comparator 1 Latching Capability
8.3.4 Comparator Delay (14-Pin Version Only)

The Comparator 2 programmable delay is controlled by a capacitor connected to the CMP2 Delay Pin; see [Figure 40](#). The capacitor value (in μF) is selected by using [Equation 1](#).

$$C_{\text{DELAY}} (\text{in } \mu\text{F}) = \frac{t_D}{5} \quad (1)$$

A simplified version of the delay circuit for Comparator 2 is shown in [Figure 30](#). The delay comparator consists of two comparator stages with the delay between them. Note that I1 and I2 cannot be turned on simultaneously; I1 corresponds to a U1 low output and I2 corresponds to a U1 high output. Using an initial assumption that the U1 output is low, I1 is on, then U2 +IN is zero. If U1 goes high, I2 supplies 120 nA to C_{DELAY} . The voltage at U2 +IN begins to ramp toward a 0.6-V threshold. When the voltage crosses this threshold, the U2 output goes high while the voltage at U2 +IN continues to ramp up to a maximum of 1.2 V when given sufficient time (twice the value of the delay specified for C_{DELAY}). This entire sequence is reversed when the comparator outputs go low, so that returning to low exhibits the same delay.

Figure 32. Server 12-V Supply Current Monitor

Feature Description (continued)

It is important to note what will happen if events occur more rapidly than the delay timeout; for example, when the U1 output goes high (turning on I2), but returns low (turning I1 back on) prior to reaching the 0.6-V transition for U2. The voltage at U2 +IN ramps back down at a rate determined by the value of C_{DELAY} , and only returns to zero if given sufficient time.

In essence, when analyzing Comparator 2 for behavior with events more rapid than its delay setting, use the model shown in Figure 30.

8.3.5 Comparator Maximum Input Voltage Range

The maximum voltage at the comparator input for normal operation is up to $(V_S) - 1.5$ V. There are special considerations when overdriving the reference inputs (pins 3 and 6). Driving either or both inputs high enough to drive 1 mA back into the reference introduces errors into the reference. Figure 33 shows the basic input structure. A general guideline is to limit the voltage on both inputs to a total of 20 V. The exact limit depends on the available voltage and whether either or both inputs are subject to the large voltage. When making this determination, consider the 20 k Ω from each input back to the comparator. Figure 34 shows the maximum input voltage that avoids creating a reference error when driving both inputs (an equivalent resistance back into the reference of 10 k Ω).

8.4 Device Functional Modes

8.4.1 Accuracy Variations as a Result of V_{SENSE} and Common-Mode Voltage

The accuracy of the INA206, INA207, and INA208 current-shunt monitors is a function of two main variables: V_{SENSE} ($V_{\text{IN}+} - V_{\text{IN}-}$) and common-mode voltage, V_{CM} , relative to the supply voltage, V_{S} . V_{CM} is expressed as $(V_{\text{IN}+} + V_{\text{IN}-})/2$; however, in practice, V_{CM} is seen as the voltage at $V_{\text{IN}+}$ because the voltage drop across V_{SENSE} is usually small.

This section addresses the accuracy of these specific operating regions:

- Normal Case 1: $V_{\text{SENSE}} \geq 20 \text{ mV}$, $V_{\text{CM}} \geq V_{\text{S}}$
- Normal Case 2: $V_{\text{SENSE}} \geq 20 \text{ mV}$, $V_{\text{CM}} < V_{\text{S}}$
- Low V_{SENSE} Case 1: $V_{\text{SENSE}} < 20 \text{ mV}$, $-16 \text{ V} \leq V_{\text{CM}} < 0$
- Low V_{SENSE} Case 2: $V_{\text{SENSE}} < 20 \text{ mV}$, $0 \text{ V} \leq V_{\text{CM}} \leq V_{\text{S}}$
- Low V_{SENSE} Case 3: $V_{\text{SENSE}} < 20 \text{ mV}$, $V_{\text{S}} < V_{\text{CM}} \leq 80 \text{ V}$

8.4.1.1 Normal Case 1: $V_{\text{SENSE}} \geq 20 \text{ mV}$, $V_{\text{CM}} \geq V_{\text{S}}$

This region of operation provides the highest accuracy. Here, the input offset voltage is characterized and measured using a two-step method. First, the gain is determined by Equation 2.

$$G = \frac{V_{\text{OUT1}} - V_{\text{OUT2}}}{100 \text{ mV} - 20 \text{ mV}}$$

where

- V_{OUT1} = Output Voltage with $V_{\text{SENSE}} = 100 \text{ mV}$
- V_{OUT2} = Output Voltage with $V_{\text{SENSE}} = 20 \text{ mV}$

Then the offset voltage is measured at $V_{\text{SENSE}} = 100 \text{ mV}$ and referred to the input (RTI) of the current-shunt monitor, as shown in Equation 3

$$V_{\text{OSRTI}} (\text{Referred - To - Input}) = \left(\frac{V_{\text{OUT1}}}{G} \right) - 100 \text{ mV}$$

In the Typical Characteristics, the *Output Error vs Common-Mode Voltage* curve shows the highest accuracy for this region of operation. In this plot, $V_{\text{S}} = 12 \text{ V}$; for $V_{\text{CM}} \geq 12 \text{ V}$, the output error is at its minimum. This case is also used to create the $V_{\text{SENSE}} \geq 20\text{-mV}$ output specifications in [Electrical Characteristics: Current-Shunt Monitor](#) through [Electrical Characteristics: General](#).

Device Functional Modes (continued)

8.4.1.2 Normal Case 2: $V_{SENSE} \geq 20 \text{ mV}$, $V_{CM} < V_S$

This region of operation has slightly less accuracy than Normal Case 1 as a result of the common-mode operating area in which the part functions, as seen in the *Output Error vs Common-mode Voltage* curve. As noted, for this graph $V_S = 12 \text{ V}$; for $V_{CM} < 12 \text{ V}$, the Output Error increases as V_{CM} becomes less than 12 V , with a typical maximum error of 0.005% at the most negative $V_{CM} = -16 \text{ V}$.

Low V_{SENSE} Case 1: $V_{SENSE} < 20 \text{ mV}$, $-16 \text{ V} \leq V_{CM} < 0$; and

Low V_{SENSE} Case 3: $V_{SENSE} < 20 \text{ mV}$, $V_S < V_{CM} \leq 80 \text{ V}$

Although the INA206 family of devices are not designed for accurate operation in either of these regions, some applications are exposed to these conditions; for example, when monitoring power supplies that are switched on and off while V_S is still applied to the INA206, INA207, or INA208. It is important to know what the behavior of the devices will be in these regions.

As V_{SENSE} approaches 0 mV, in these V_{CM} regions, the device output accuracy degrades. A larger-than-normal offset can appear at the current-shunt monitor output with a typical maximum value of $V_{OUT} = 300 \text{ mV}$ for $V_{SENSE} = 0 \text{ mV}$. As V_{SENSE} approaches 20 mV, V_{OUT} Returns to the expected output value with accuracy as specified in [Electrical Characteristics: Current-Shunt Monitor](#) through [Electrical Characteristics: General](#). Figure 38 illustrates this effect using the INA208 (Gain = 100).

Figure 38. Example for Low V_{SENSE} Cases 1 and 3 (INA208, Gain = 100)

8.4.1.3 Low V_{SENSE} Case 2: $V_{SENSE} < 20 \text{ mV}$, $0 \text{ V} \leq V_{CM} \leq V_S$

This region of operation is the least accurate for the INA206 family. To achieve the wide input common-mode voltage range, these devices use two op amp front ends in parallel. One op amp front end operates in the positive input common-mode voltage range, and the other in the negative input region. For this case, neither of these two internal amplifiers dominates and overall loop gain is very low. Within this region, V_{OUT} approaches voltages close to linear operation levels for Normal Case 2. This deviation from linear operation becomes greatest the closer V_{SENSE} approaches 0 V. Within this region, as V_{SENSE} approaches 20 mV, device operation is closer to that described by Normal Case 2. Figure 39 illustrates this behavior for the INA208. The V_{OUT} maximum peak for this case is tested by maintaining a constant V_S , setting $V_{SENSE} = 0 \text{ mV}$ and sweeping V_{CM} from 0 V to V_S . The exact V_{CM} at which V_{OUT} peaks during this test varies from part to part, but the V_{OUT} maximum peak is tested to be less than the specified V_{OUT} Tested Limit.

Device Functional Modes (continued)

NOTE: (1) INA206 V_{OUT} Tested Limit = 0.4V. INA207 V_{OUT} Tested Limit = 1V.

Figure 39. Example for Low V_{SENSE} Case 2 (INA208, Gain = 100)

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Basic Connection

Figure 40 shows the basic connection of the INA206, INA207, and INA208. The input pins, VIN+ and VIN–, should be connected as closely as possible to the shunt resistor to minimize any resistance in series with the shunt resistance.

Power-supply bypass capacitors are required for stability. Applications with noisy or high impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

Figure 40. INA20x Basic Connection

9.2 Typical Application

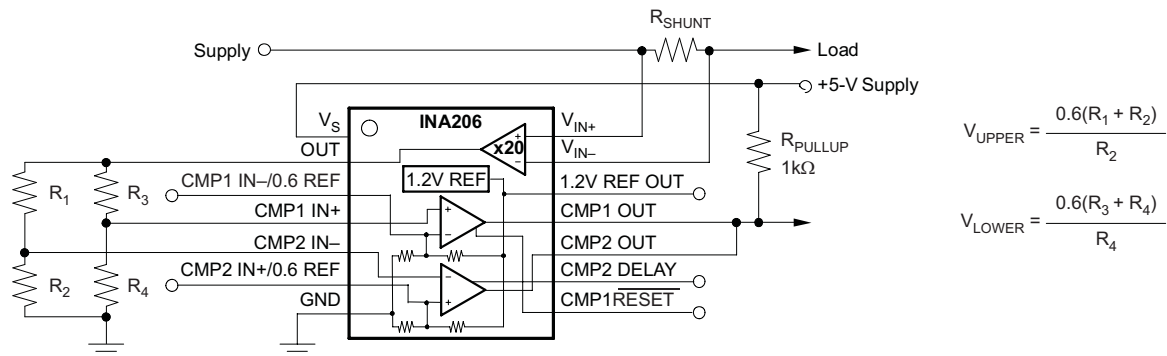

Figure 41. Using the INA206, INA207, and INA208 as Window Comparators

Typical Application (continued)

9.2.1 Design Requirements

The device measures current through a resistive shunt with current flowing in one direction. The outputs of the two comparators are in logic AND connection thus enabling the window comparison. When the INA output voltage is within the upper and lower limits, the composite comparator output is high. When the INA output voltage is above the upper limit or below the lower limit, the composite comparator output remains low.

9.2.2 Detailed Design Procedure

9.2.2.1 Selecting R_S

The value chosen for the shunt resistor, R_S , depends on the application and is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement line. High values of R_S provide better accuracy at lower currents by minimizing the effects of offset, while low values of R_S minimize voltage loss in the supply line. For most applications, best performance is attained with an R_S value that provides a full-scale shunt voltage range of 50 mV to 100 mV. Maximum input voltage for accurate measurements is $(V_S - 0.2) / \text{Gain}$.

9.2.2.2 Transient Protection

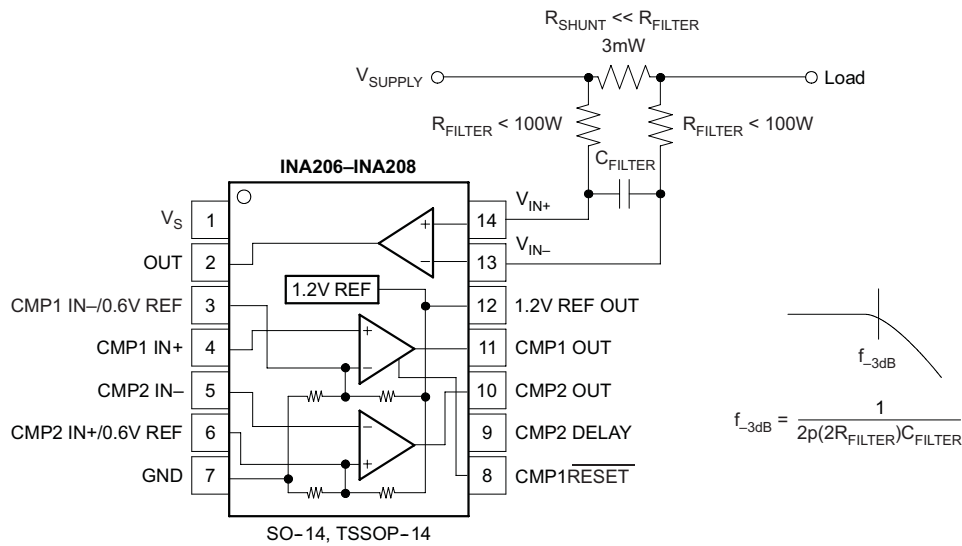

The –16-V to 80-V common-mode range of the INA206, INA207, and INA208 is ideal for withstanding automotive fault conditions ranging from 12-V battery reversal up to 80-V transients, since no additional protective components are needed up to those levels. In the event that the INA206, INA207, and INA208 are exposed to transients on the inputs in excess of their ratings, then external transient absorption with semiconductor transient absorbers (*Zeners* or *Transzorbs*) will be necessary. Use of MOVs or VDRs is not recommended except when they are used in addition to a semiconductor transient absorber. Select the transient absorber such that it will never allow the INA206, INA207, and INA208 to be exposed to transients greater than 80 V (that is, allow for transient absorber tolerance, as well as additional voltage due to transient absorber dynamic impedance). Despite the use of internal Zener-type ESD protection, the INA206, INA207, and INA208 do not lend themselves to using external resistors in series with the inputs since the internal gain resistors can vary up to $\pm 30\%$ but are closely matched. (If gain accuracy is not important, then resistors can be added in series with the INA206, INA207, and INA208 inputs with two equal resistors on each input.)

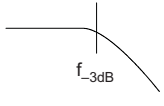

9.2.2.3 Input Filtering

An obvious and straightforward location for filtering is at the output of the INA206, INA207, and INA208 series; however, this location negates the advantage of the low output impedance of the internal buffer. The only other option for filtering is at the input pins of the INA206, INA207, and INA208, which is complicated by the internal 5 k Ω + 30% input impedance; this is shown in [Figure 42](#). Using the lowest possible resistor values minimizes both the initial shift in gain and effects of tolerance. The effect on initial gain is given by [Equation 4](#).

$$\text{Gain Error\%} = 100 - \left(100 \times \frac{5 \text{ k}\Omega}{5 \text{ k}\Omega + R_{\text{FILT}}} \right) \quad (4)$$

Total effect on gain error can be calculated by replacing the 5-k Ω term with 5 k Ω – 30%, (or 3.5 k Ω) or 5 k Ω + 30%, (or 6.5 k Ω). The tolerance extremes of R_{FILT} can also be inserted into the equation. If a pair of 100 Ω 1% resistors are used on the inputs, the initial gain error will be 1.96%. Worst-case tolerance conditions will always occur at the lower excursion of the internal 5-k Ω resistor (3.5 k Ω), and the higher excursion of R_{FILT} — 2.8% in this case.

Typical Application (continued)

$$f_{-3dB} = \frac{1}{2\pi(2R_{FILTER})C_{FILTER}}$$

Figure 42. Input Filter (Gain Error 1.5% to 2.8%)

Note that the specified accuracy of the INA26, INA207, and INA208 must then be combined in addition to these tolerances. While this discussion treated accuracy worst-case conditions by combining the extremes of the resistor values, it is appropriate to use geometric mean or root sum square calculations to total the effects of accuracy variations.

Typical Application (continued)

9.2.3 Application Curve

Figure 43. Window Comparator Circuit Response

10 Power Supply Recommendations

The input circuitry of the INA206, INA207, and INA208 can accurately measure beyond the power-supply voltage, V_s . For example, the V_s power supply can be 5 V, whereas the load power-supply voltage is up to 80 V. The output voltage range of the OUT terminal, however, is limited by the voltages on the power-supply pin.

11 Layout

11.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- The power-supply bypass capacitor must be placed as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

11.2 Layout Example

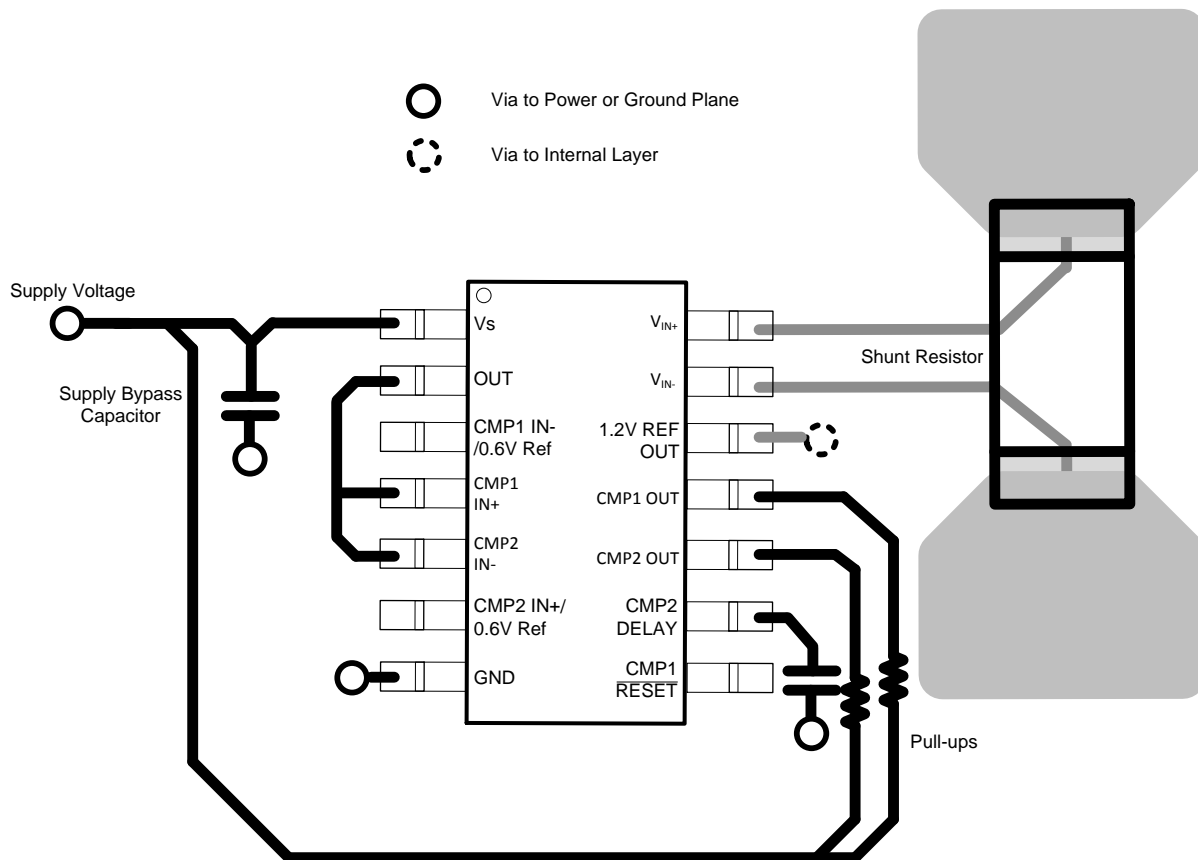

Figure 44. Layout Recommendation

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

DGS (S-PDSO-G10)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion.
 - D. Falls within JEDEC MO-187 variation BA.

DGS (S-PDSO-G10)

PLASTIC SMALL OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 -  Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
 -  Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
 - E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
