

TPS53311 3-A Step-Down Regulator With Integrated Switcher

1 Features

- 95.5% Maximum Efficiency
- Continuous 3-A Output Current
- Supports All MLCC Output Capacitor
- SmoothPWM™ Auto-Skip Eco-mode™ for Light-Load Efficiency
- Voltage Mode Control
- Supports Master-Slave Interleaved Operation
- Synchronization up to $\pm 20\%$ of Nominal Frequency
- Conversion Voltage Range From 2.9 V to 6 V
- Soft-Stop Output Discharge During Disable
- Adjustable Output Voltage Ranging From 0.6 V to $0.84 V \times V_{IN}$
- Overcurrent, Overvoltage, and Overtemperature Protection
- Small, 3 mm \times 3 mm, 16-Pin VQFN Package
- Open-Drain Power Good Indication
- Internal Boot Strap Switch
- Low $R_{DS(on)}$, 24 m Ω With 3.3-V Input and 19-m Ω With 5-V Input
- Supports Prebias Start-Up Functionality

2 Applications

- 5-V Step-Down Rail
- 3.3-V Step-Down Rail

3 Description

The TPS53311 provides a fully integrated 3-V to 5-V V_{IN} integrated synchronous FET converter solution with 16 total components, in 200 mm² of PCB area. Due to the low $R_{DS(on)}$ and TI Proprietary SmoothPWM™ skip mode of operation, it enables 95.5% peak efficiency, and over 90% efficiency at loads as light as 100 mA. It requires only two 22- μ F ceramic output capacitors for a power-dense, 3-A solution.

The TPS53311 features a 1.1-MHz switching frequency, SKIP mode operation support, prebias start-up, internal soft start, output soft discharge, internal VBST switch, power good, EN/input UVLO, overcurrent, overvoltage, undervoltage, and overtemperature protections and all ceramic output capacitor support. It supports supply voltage from 2.9 V to 3.5 V and conversion voltage from 2.9 V to 6 V, and output voltage is adjustable from 0.6 V to $0.84 V \times V_{IN}$.

The TPS53311 is available in the 3 mm \times 3 mm 16-pin VQFN package (Green RoHs compliant and Pb free) and operates between -40°C and 85°C .

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS53311	VQFN (16)	3.00 mm \times 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (March 2011) to Revision B	Page
• Added <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1
• Deleted <i>Ordering Information</i> table; see POA at the end of the data sheet.....	1
• Added <i>Thermal Information</i> table	5
• Deleted <i>Package Dissipation Ratings</i> table.....	5
• Changed value of component R2 in <i>Typical Application Circuit Diagram</i> From: 4.02 kΩ To: 2.67 kΩ.....	13
• Changed value of component V _{OUT} on TPS53311 Master in <i>Master and Slave Configuration Schematic</i> From: 1.2 V To: 1.5 V	17
• Changed value of component R2 on TPS53311 Master in <i>Master and Slave Configuration Schematic</i> From: 4.02 kΩ To: 2.67 kΩ.....	17
• Changed value of component V _{OUT} on TPS53311 Slave in <i>Master and Slave Configuration Schematic</i> From: 1.5 V To: 1.2 V	17
• Changed value of component R12 on TPS53311 Slave in <i>Master and Slave Configuration Schematic</i> From: 2.67 kΩ To: 4.02 kΩ.....	17

Changes from Original (June 2010) to Revision A	Page
• Added bullets to <i>Features</i>	1
• Changed <i>Description</i> for clarity	1
• Changed <i>Absolute Maximum Ratings</i> output voltage (SW pin DC) minimum from 0.3 V to –1 V (typographical error)	4
• Added information regarding DE mode in <i>Master/Slave Operation and Synchronization</i> section	11
• Changed value of component C2 in <i>Typical Application Circuit Diagram</i> to 2.2 nF (typographical error)	13
• Changed component labels and values in <i>Master/Slave Configuration Schematic</i> (typographical error)	17

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1	EN	I	Enable. Internally pulled up to VDD with a 1.35-M Ω resistor.
2	SYNC	B	Synchronization signal for input interleaving. Master SYNC pin sends out 180° out-of-phase signal to slave SYNC. SYNC frequency must be within $\pm 20\%$ of slave nominal frequency.
3	PGD	O	Power good output flag. Open drain output. Pull up to an external rail through a resistor.
4	VBST	P	Supply input for high-side MOSFET (bootstrap terminal). Connect capacitor from this pin to SW terminal.
5	SW	B	Output inductor connection to integrated power devices.
6	SW	B	Output inductor connection to integrated power devices.
7	SW	B	Output inductor connection to integrated power devices.
8	PS	I	Mode configuration pin (with 10 μ A current): Connecting to ground: Forced CCM slave. Pulled high or floating (internal pulled high): Forced CCM master. Connect with 24.3 k Ω to GND: DE slave. Connect with 57.6 k Ω to GND: HEF mode. Connect with 105 k Ω to GND: reserved mode. Connect with 174 k Ω to GND: DE master.
9	COMP	O	Error amplifier compensation terminal. Type III compensation method is recommended for stability.
10	FB	I	Voltage feedback. Also used for OVP, UVP, and PGD determination.
11	AGND	G	Device analog ground terminal.
12	VDD	P	Input bias supply for analog functions.
13	VIN	P	Gate driver supply and power conversion voltage.
14	VIN	P	Gate driver supply and power conversion voltage.
15	PGND	P	IC power GND terminal.
16	PGND	P	IC power GND terminal.

(1) B = Bidirectional, G = Ground, I = Input, O = Output, P = Supply

6 Specifications

6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT	
Input voltage	VIN, EN	-0.3	7	V	
	VBST	-0.3	17		
	VBST(with respect to SW)	-0.3	7		
	FB, PS, VDD	-0.3	3.7		
Output voltage	SW	DC	-1	7	V
		Pulse < 20 ns, E = 5 μJ	-3	10	
	PGD	-0.3	7		
	COMP, SYNC	-0.3	3.7		
	PGND	-0.3	0.3		
Operating temperature, T _A		-40	85	°C	
Junction temperature, T _J		-40	150	°C	
Storage temperature, T _{stg}		-55	150	°C	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Input voltage	VIN	2.9		6	V
	VDD	2.9	3.3	3.5	
	VBST	-0.1		13.5	
	VBST(with respect to SW)	-0.1		6	
	EN	-0.1		6	
	FB, PS	-0.1		3.5	
Output voltage	SW	-1		6.5	V
	PGD	-0.1		6	
	COMP, SYNC	-0.1		3.5	
	PGND	-0.1		0.1	
Junction temperature, T _J		-40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS53311	
		RGT (VQFN)	
		16 PINS	
Symbol	Description	Value	Unit
$R_{\theta JA}$	Junction-to-ambient thermal resistance	42.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	51.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	16	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.7	°C/W
ψ_{JB}	Junction-to-board characterization parameter	16	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	4.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

over recommended free-air temperature range, $V_{IN} = 3.3\text{ V}$, $V_{DD} = 3.3\text{ V}$, PGND = GND (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY: VOLTAGE, CURRENTS, AND UVLO						
V_{IN}	VIN supply voltage	Nominal input voltage	2.9		6	V
$I_{VINS DN}$	VIN shutdown current	EN = LO			3	μA
V_{UVLO}	VIN UVLO threshold	Ramp up, EN = HI		2.8		V
$V_{UVLOHYS}$	VIN UVLO hysteresis	VIN UVLO Hysteresis		130		mV
V_{DD}	Internal circuitry supply voltage	Nominal 3.3-V input voltage	2.9	3.3	3.5	V
I_{DDSDN}	VDD shut down current	EN = LO			5	μA
I_{DD}	Standby current	EN = HI, no switching		2.2	3.5	mA
V_{DDUVLO}	3.3-V UVLO threshold	Ramp up, EN = HI		2.8		V
$V_{DDUVLOHYS}$	3.3-V UVLO hysteresis			75		mV
VOLTAGE FEEDBACK LOOP: VREF AND ERROR AMPLIFIER						
V_{VREF}	VREF	Internal precision reference voltage		0.6		V
TOL_{VREF}	VREF Tolerance	$0^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$	-1%		1%	
		$-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$	-1.25%		1.25%	
$UGBW^{(1)}$	Unity gain bandwidth		14			MHz
$A_{OL}^{(1)}$	Open loop gain		80			dB
I_{FBINT}	FB input leakage current	Sourced from FB pin			30	nA
$I_{EAMAX}^{(1)}$	Output sinking and sourcing current	$C_{COMP} = 20\text{ pF}$		5		mA
$SR^{(1)}$	Slew rate			5		V/μs
OCP: OVER CURRENT AND ZERO CROSSING						
$I_{OCP L}$	Overcurrent limit on upper FET	When I_{OUT} exceeds this threshold for 4 consecutive cycles. $V_{IN} = 3.3\text{ V}$, $V_{OUT} = 1.5\text{ V}$ with 1-μH inductor, $T_A = 25^{\circ}\text{C}$	4.2	4.5	4.8	A
$I_{OCP H}$	One time overcurrent latch off on the lower FET	Immediately shut down when sensed current reach this value. $V_{IN} = 3.3\text{ V}$, $V_{OUT} = 1.5\text{ V}$ with 1-μH inductor, $T_A = 25^{\circ}\text{C}$	4.8	5.1	5.5	A
$V_{ZXOFF}^{(1)}$	Zero crossing comparator internal offset	PGND – SW, SKIP mode	-4.5	-3	-1.5	mV
PROTECTION: OVP, UVP, PGD, AND INTERNAL THERMAL SHUTDOWN						
V_{OVP}	Overvoltage protection threshold voltage	Measured at FB wrt. VREF	114%	117%	120%	
V_{UVP}	Undervoltage protection threshold voltage	Measured at FB wrt. VREF	80%	83%	86%	
V_{PGDL}	PGD low threshold	Measured at FB wrt. VREF	80%	83%	86%	

(1) Ensured by design. Not production tested.

Electrical Characteristics (continued)

 over recommended free-air temperature range, $V_{IN} = 3.3\text{ V}$, $V_{VDD} = 3.3\text{ V}$, $PGND = GND$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{PGDU}	PGD upper threshold	Measured at FB wrt. VREF	114%	117%	120%	
$V_{INMINPG}$	Minimum V_{IN} voltage for valid PGD at start up.	Measured at V_{IN} with 1-mA (or 2-mA) sink current on PGD pin at start up		1		V
THSD ⁽¹⁾	Thermal shutdown	Latch off controller, attempt soft-stop	130	140	150	°C

7 Detailed Description

7.1 Overview

The TPS53311 is a high-efficiency switching regulator with two integrated N-channel MOSFETs and is capable of delivering up to 3 A of load current. The TPS53311 provides output voltage between 0.6 V and $0.84 \times V_{IN}$ from 2.9-V to 6-V wide input voltage range.

This device employs five operation modes to fit various application requirements. The *master and slave* mode enables a two-phase interleaved operation to reduce input ripple. The *skip* mode operation provides reduced power loss and increases the efficiency at light load. The unique, patented PWM modulator enables smooth light load to heavy load transition while maintaining fast load transient.

7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 Soft Start

The soft-start function reduces the inrush current during the start-up sequence. A slow-rising reference voltage is generated by the soft-start circuitry and sent to the input of the error amplifier. When the soft-start ramp voltage is less than 600 mV, the error amplifier uses this ramp voltage as the reference. When the ramp voltage reaches 600 mV, the error amplifier switches to a fixed 600-mV reference. The typical soft-start time is 400 μ s.

Feature Description (continued)

7.3.2 Power Good

The TPS53311 monitors the voltage on the FB pin. If the FB voltage is between 83% and 117% of the reference voltage, the power good signal remains high. If the FB voltage falls outside of these limits, the internal open-drain output pulls the power good pin (PGD) low.

During start-up, the input voltage must be higher than 1 V to have valid power good logic, and the power good signal is delayed for 400 μ s after the FB voltage falls to within the power good limits. There is also 10- μ s delay during the shutdown sequence.

7.3.3 Undervoltage Lockout (UVLO) Function

The TPS53311 provides undervoltage lockout (UVLO) protection for both power input (V_{IN}) and bias input (VDD) voltage. If either of them is lower than the UVLO threshold voltage minus the hysteresis, the device shuts off. When the voltage rises above the threshold voltage, the device restarts. The typical UVLO rising threshold is 2.8 V for both V_{IN} and V_{VDD} . A hysteresis voltage of 130 mV for V_{IN} and 75 mV for V_{VDD} is also provided to prevent glitch.

7.3.4 Overcurrent Protection

The TPS53311 continuously monitors the current flowing through the high-side and the low-side MOSFETs. If the current through the high-side FET exceeds 4.5 A, the high-side FET turns off and the low-side FET turns on until the next PWM cycle. An overcurrent (OC) counter starts to increment each occurrence of an overcurrent event. The converter shuts down immediately when the OC counter reaches four. The OC counter resets if the detected current is less 4.5 A after an OC event.

Another set of overcurrent circuitry monitors the current flowing through low-side FET. If the current through the low-side FET exceeds 5.1 A, the overcurrent protection is enabled and immediately turns off both the high-side and the low-side FETs and shuts down the converter. The device is fully protected against overcurrent during both on-time and off-time. This protection is latched. See TPS53310 data sheet, [3-A Step-Down Regulator with Integrated Switcher](#) (SLUSA68), for information on hiccup overcurrent protection.

7.3.5 Overvoltage Protection

The TPS53311 monitors the voltage divided feedback voltage to detect overvoltage and undervoltage conditions. When the feedback voltage is greater than 117% of the reference, the high-side MOSFET turns off and the low-side MOSFET turns on. The output voltage then drops until it reaches the undervoltage threshold. At that point the low-side MOSFET turns off and the device enters a high-impedance state.

7.3.6 Undervoltage Protection

When the feedback voltage is lower than 83% of the reference voltage, the undervoltage protection timer starts. If the feedback voltage remains lower than the undervoltage threshold voltage after 10 μ s, the device turns off both the high-side and the low-side MOSFETs and goes into a high-impedance state. This protection is latched.

7.3.7 Overtemperature Protection

The TPS53311 continuously monitors the die temperature. If the die temperature exceeds the threshold value (140°C typical), the device shuts off. When the device temperature falls to 40°C below the overtemperature threshold, it restarts and returns to normal operation.

7.3.8 Output Discharge

When the enable pin is low, the TPS53311 discharges the output capacitors through an internal MOSFET switch between SW and PGND while high-side and low-side MOSFETs remain off. The typical discharge switch-on resistance is 60 Ω . This function is disabled when V_{IN} is less than 1 V.

Feature Description (continued)

7.3.9 Master and Slave Operation and Synchronization

Two TPS53311 can operate interleaved when configured as master and slave. The SYNC pins of the two devices are connected together for synchronization. In CCM, the master device sends the 180° out-of-phase pulse to the slave device through the SYNC pin, which determines the leading edge of the PWM pulse. If the slave device does not receive the SYNC pulse from the master device or if the SYNC connection is broken during operation, the slave device continues to operate using its own internal clock.

In DE mode, the master and slave switching node does not synchronize to each other if either one of them is operating in DCM. When both master and slave enters CCM, the switching nodes of master and slave synchronize to each other.

The SYNC pin of the slave device can also connect to external clock source within $\pm 20\%$ of the 1.1-MHz switching frequency. The falling edge of the SYNC triggers the rising edge of the PWM signal.

7.4 Device Functional Modes

7.4.1 Operation Mode

The TPS53311 offers five operation modes determined by the PS pin connections listed in [Table 1](#).

Table 1. Operation Mode Selection

PS PIN CONNECTION	OPERATION MODE	AUTO-SKIP AT LIGHT LOAD	MASTER AND SLAVE SUPPORT
GND	FCCM Slave	—	Slave
24.3 k Ω to GND	DE Slave	Yes	Slave
57.6 k Ω to GND	HEF Mode	Yes	—
174 k Ω to GND	DE Master	Yes	Master
Floating or pulled to VDD	FCCM Master	—	Master

In *forced continuous conduction mode* (FCCM), the high-side FET is ON during the on-time and the low-side FET is ON during the off-time. The switching is synchronized to the internal clock thus the switching frequency is fixed.

In *diode emulation* mode (DE), the high-side FET is ON during the on-time and low-side FET is ON during the off-time until the inductor current reaches zero. An internal zero-crossing comparator detects the zero crossing of inductor current from positive to negative. When the inductor current reaches zero, the comparator sends a signal to the logic control and turns off the low-side FET.

When the load is increased, the inductor current is always positive and the zero-crossing comparator does not send a zero-crossing signal. The converter enters into *continuous conduction mode* (CCM) when no zero-crossing is detected for two consecutive PWM pulses. The switching synchronizes to the internal clock and the switching frequency is fixed.

In *high-efficiency* mode (HEF), the operation is the same as diode emulation mode at light load. However, the converter does not synchronize to the internal clock during CCM. Instead, the PWM modulator determines the switching frequency.

7.4.2 Light Load Operation

In skip modes (DE and HEF) when the load current is less than one-half of the inductor peak current, the inductor current becomes negative by the end of off-time. During light load operation, the low-side MOSFET is turned off when the inductor current reaches zero. The energy delivered to the load per switching cycle is increased compared to the normal PWM mode operation and the switching frequency is reduced. The switching loss is reduced, thereby improving efficiency.

In both DE and HEF mode, the switching frequency is reduced in discontinuous conduction mode (DCM). When the load current is 0 A, the minimum switching frequency is reached. The difference between $V_{V_{BST}}$ and V_{SW} must be maintained at a value higher than 2.4 V.

7.4.3 Forced Continuous Conduction Mode

When the PS pin is grounded or greater than 2.2 V, the TPS53311 is operating in *forced continuous conduction mode* in both light-load and heavy-load conditions. In this mode, the switching frequency remains constant over the entire load range, making it suitable for applications that need tight control of switching frequency at a cost of lower efficiency at light load.

8 Application and Implementation

NOTE

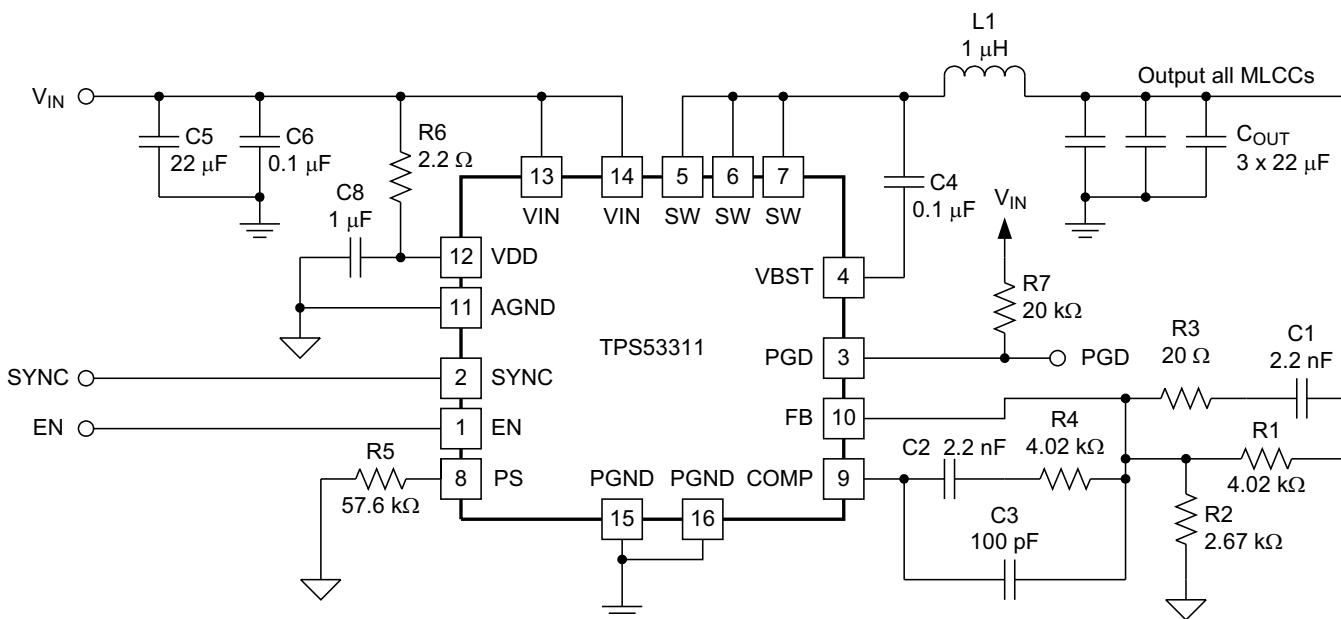

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS53311 device is a high-efficiency synchronous-buck converter. The device suits low-output voltage point-of-load applications with 3-A or lower output current in computing and similar digital consumer applications.

8.2 Typical Application

This design example describes a voltage-mode, 3-A synchronous buck converter with integrated MOSFETs. The TPS53311 device provides a fixed 1.5-V output at up to 3 A from a 3.3-V input bus.

Copyright © 2016, Texas Instruments Incorporated

Figure 13. Typical 3.3-V Input Application Circuit Diagram

8.2.1 Design Requirements

Table 2 lists the parameters for this design example.

Table 2. TPS53311 Design Example Specifications

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT CHARACTERISTICS					
Input voltage, V_{IN}	V_{IN}	2.9	3.3	6	V
Maximum input current	$V_{IN} = 3.3\text{ V}, 1.5\text{ V or }3\text{ A}$			2.82	A
No load input current	$V_{IN} = 3.3\text{ V}, 1.5\text{ V or }0\text{ A}$			40	mA
OUTPUT CHARACTERISTICS					
Output voltage, V_O		1.485	1.5	1.515	V
Output voltage regulation	Line regulation		0.1%		
	Load regulation		1%		

Typical Application (continued)

Table 2. TPS53311 Design Example Specifications (continued)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Output voltage ripple	$V_{IN} = 3.3\text{ V}, 1.5\text{ V}$ or 0 A to 3 A			20	mVpp
Output load current		0		3	A
Output over current			4.5		A
SYSTEMS CHARACTERISTICS					
Switching frequency	Fixed		1.1		MHz
1.5-V full load efficiency	$V_{IN} = 3.3\text{ V}, 1.5\text{ V}$ or 3 A		88.82%		
	$V_{IN} = 5\text{ V}, 1.5\text{ V}$ or 3 A		89.5%		
Operating temperature			25		°C

8.2.2 Detailed Design Procedure

Select the external components using the following steps.

8.2.2.1 Determine the Value of R1 and R2

The output voltage is programmed by the voltage-divider resistor, R1 and R2 shown in [Figure 13](#). R1 is connected between the FB pin and the output, and R2 is connected between the FB pin and GND. The recommended value for R1 is from 1 kΩ to 5 kΩ. Determine R2 using equation in [Equation 1](#).

$$R2 = \frac{0.6}{V_{OUT} - 0.6} \times R1 \quad (1)$$

8.2.2.2 Choose the Inductor

The inductance value must be determined to give the ripple current of approximately 20% to 40% of maximum output current. The inductor ripple current is determined by [Equation 2](#).

$$I_{L(\text{ripple})} = \frac{1}{L \times f_{SW}} \times \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{V_{IN}} \quad (2)$$

The inductor also needs to have low DCR to achieve good efficiency, as well as enough room above peak inductor current before saturation.

8.2.2.3 Choose the Output Capacitor(s)

The output capacitor selection is determined by output ripple and transient requirement. When operating in CCM, the output ripple has three components calculated with [Equation 3](#) through [Equation 6](#).

$$V_{RIPPLE} = V_{RIPPLE(C)} + V_{RIPPLE(ESR)} + V_{RIPPLE(ESL)} \quad (3)$$

$$V_{RIPPLE(C)} = \frac{I_{L(\text{ripple})}}{8 \times C_{OUT} \times f_{SW}} \quad (4)$$

$$V_{RIPPLE(ESR)} = I_{L(\text{ripple})} \times ESR \quad (5)$$

$$V_{RIPPLE(ESL)} = \frac{V_{IN} \times ESL}{L} \quad (6)$$

When ceramic output capacitors are used, the ESL component is usually negligible. In the case when multiple output capacitors are used, ESR and ESL must be the equivalent of ESR and ESL of all the output capacitor in parallel.

When operating in DCM, the output ripple is dominated by the component determined by capacitance. It also varies with load current and can be expressed as shown in [Equation 7](#).

$$V_{\text{RIPPLE(DCM)}} = \frac{(\alpha \times I_{L(\text{ripple})} - I_{\text{OUT}})^2}{2 \times C_{\text{OUT}} \times f_{\text{SW}} \times I_{L(\text{ripple})}}$$

where

- α is the DCM on-time coefficient and can be expressed in Equation 8 (typical value 1.25) (7)

$$\alpha = \frac{t_{\text{ON(DCM)}}}{t_{\text{ON(CCM)}}}$$

Figure 14. DCM V_{OUT} Ripple Calculation

8.2.2.4 Choose the Input Capacitor

The selection of input capacitor must be determined by the ripple current requirement. The ripple current generated by the converter needs to be absorbed by the input capacitors as well as the input source. The RMS ripple current from the converter can be expressed in Equation 9.

$$I_{\text{IN(ripple)}} = I_{\text{OUT}} \times \sqrt{D \times (1-D)}$$

where

- D is the duty cycle and can be expressed as shown in Equation 10 (9)

$$D = \frac{V_{\text{OUT}}}{V_{\text{IN}}}$$

To minimize the ripple current drawn from the input source, sufficient input decoupling capacitors must be placed close to the device. TI recommends the ceramic capacitor because it provides low ESR and low ESL. The input voltage ripple can be calculated as shown in Equation 11 when the total input capacitance is determined.

$$V_{\text{IN(ripple)}} = \frac{I_{\text{OUT}} \times D}{f_{\text{SW}} \times C_{\text{IN}}}$$

8.2.2.5 Compensation Design

The TPS53311 uses voltage mode control. To effectively compensate the power stage and ensure fast transient response, Type III compensation is typically used.

The control to output transfer function can be described in Equation 12.

$$G_{CO} = 4 \times \frac{1 + s \times C_{OUT} \times ESR}{1 + s \times \left(\frac{L}{DCR + R_{LOAD}} + C_{OUT} \times (ESR + DCR) \right) + s^2 \times L \times C_{OUT}} \quad (12)$$

The output L-C filter introduces a double pole which can be calculated as shown in [Equation 13](#).

$$f_{DP} = \frac{1}{2 \times \pi \times \sqrt{L \times C_{OUT}}} \quad (13)$$

The ESR zero can be calculated as shown in [Equation 14](#).

$$f_{ESR} = \frac{1}{2 \times \pi \times ESR \times C_{OUT}} \quad (14)$$

[Figure 15](#) and [Figure 16](#) show the configuration of Type III compensation and typical pole and zero locations. [Equation 16](#) through [Equation 20](#) describe the compensator transfer function and poles and zeros of the Type III network.

UGD-10058

UDG-10057

Figure 15. Type III Compensation Network Configuration Schematic

Figure 16. Type III Compensation Gain Plot and Zero/Pole Placement

$$G_{EA} = \frac{(1 + s \times C_1 \times (R_1 + R_3))(1 + s \times R_4 \times C_2)}{(s \times R_1 \times (C_2 + C_3)) \times (1 + s \times C_1 \times R_3) \times \left(1 + s \times R_4 \times \frac{C_2 \times C_3}{C_2 + C_3} \right)} \quad (15)$$

$$f_{Z1} = \frac{1}{2 \times \pi \times R_4 \times C_2} \quad (16)$$

$$f_{Z2} = \frac{1}{2 \times \pi \times (R_1 + R_3) \times C_1} \cong \frac{1}{2 \times \pi \times R_1 \times C_1} \quad (17)$$

$$f_{P1} = 0 \quad (18)$$

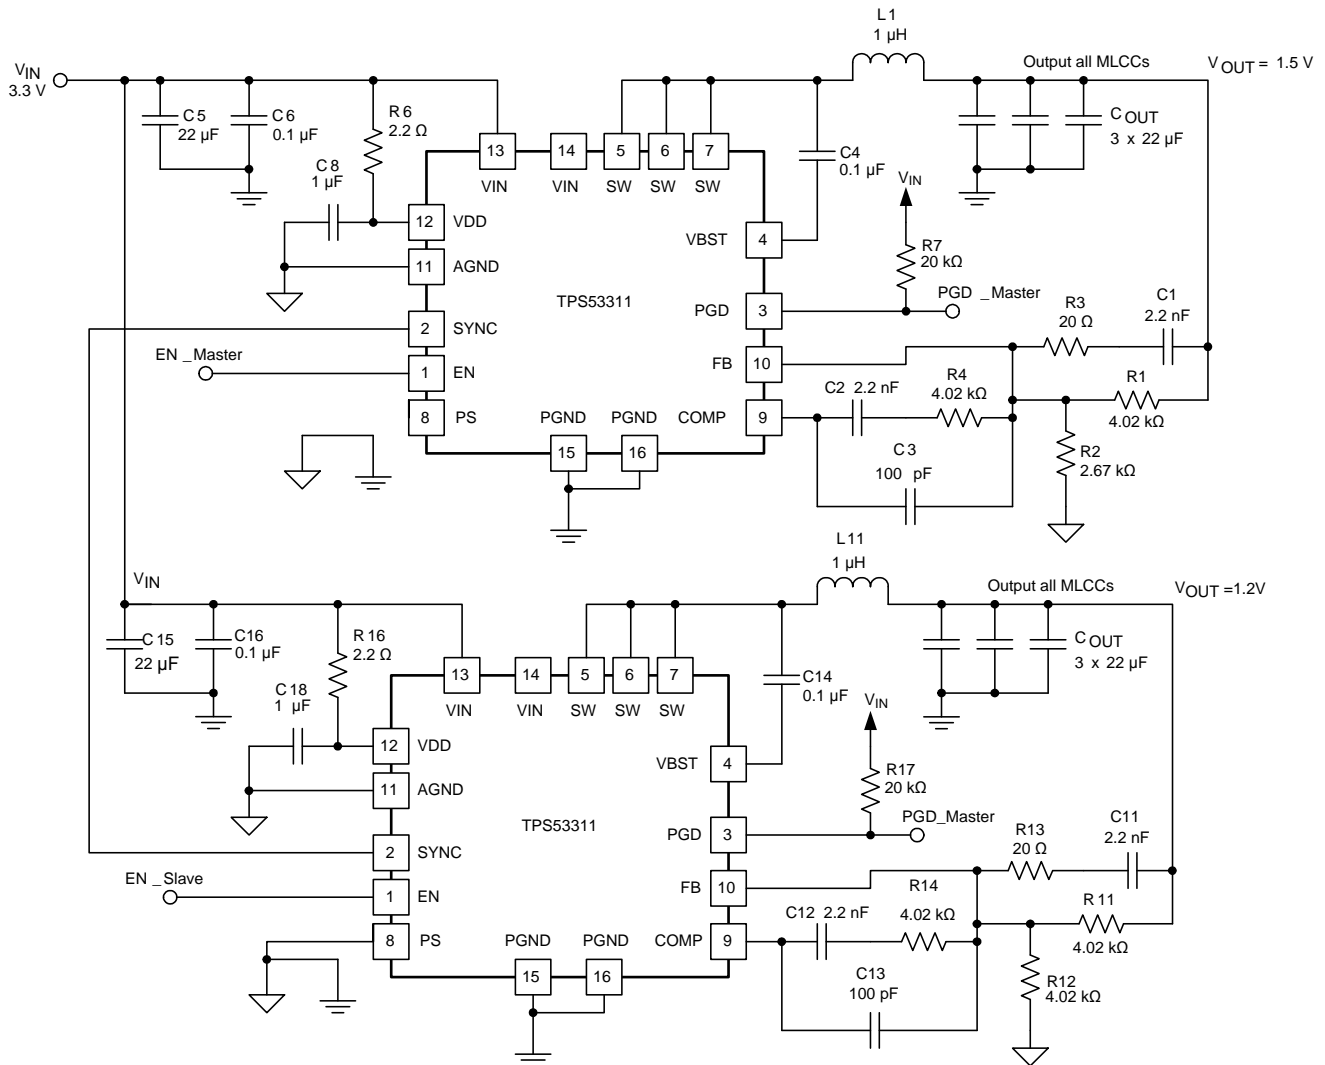

$$f_{P2} = \frac{1}{2 \times \pi \times R_3 \times C_1} \quad (19)$$

$$f_{P3} = \frac{1}{2 \times \pi \times R_4 \times \left(\frac{C_2 \times C_3}{C_2 + C_3} \right)} \cong \frac{1}{2 \times \pi \times R_4 \times C_3} \quad (20)$$

The two zeros can be placed near the double pole frequency to cancel the response from the double pole. One pole can be used to cancel ESR zero, and the other non-zero pole can be placed at half switching frequency to attenuate the high frequency noise and switching ripple. Suitable values can be selected to achieve a compromise between high phase margin and fast response. A phase margin higher than 45 degrees is required for stable operation.

For DCM operation, a C3 between 56 pF and 150 pF is recommended for output capacitance between 20 μF to 200 μF.

9 Power Supply Recommendations

The TPS53311 device is designed to operate from an input voltage supply range from 2.9 V to 6 V (2.9 V to 3.5 V biased). This input supply must be well regulated. Proper bypassing of input supplies and internal regulators is also critical for noise performance, as is PCB layout and grounding scheme. See the recommendations in [Layout](#).

10 Layout

10.1 Layout Guidelines

Good layout is essential for stable power supply operation. Follow these guidelines for a clean PCB layout:

- Separate the power ground and analog ground planes. Connect them together at one location.
- Use four vias to connect the thermal pad to power ground.
- Place V_{IN} and V_{DD} decoupling capacitors as close to the device as possible.
- Use wide traces for V_{IN} , V_{OUT} , PGND and SW. These nodes carry high current and also serve as heat sinks.
- Place feedback and compensation components as close to the device as possible.
- Keep analog signals (FB, COMP) away from noisy signals (SW, SYNC, VBST).
- See [Using the TPS53311EVM-561, a 3-A Eco-mode™ Integrated Switcher With Master Slave](#) (SLUU428) for a layout example.

10.2 Layout Example

Figure 23. TPS533x Layout Example

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

SmoothPWM, Eco-mode, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS53311RGTR	ACTIVE	QFN	RGT	16	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	3311	Samples
TPS53311RGTT	ACTIVE	QFN	RGT	16	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	3311	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - Quad Flatpack, No-leads (QFN) package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-220.

THERMAL PAD MECHANICAL DATA

RGT (S-PVQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
