

TPS6106x Constant Current LED Driver With Digital and PWM Brightness Control

1 Features

- LED Driver With Integrated Overvoltage and Short-Circuit Protection
- 2.7-V to 6-V Input Voltage Range
- 500-mV or 250-mV Feedback Voltage
- TPS61060 Powers up to 3 LEDs
- TPS61061 Powers up to 4 LEDs
- TPS61062 Powers up to 5 LEDs
- PWM Brightness Control on Enable
- Digital Brightness Control on ILED
- 1-MHz Fixed Switching Frequency
- 400-mA Internal Power MOSFET Switch
- LEDs Disconnected During Shutdown
- Operates With Small-Output Capacitors Down to 220 nF
- Up to 80% Efficiency
- 8-Pin NanoFree™ Package (Chipscale, CSP)
- 3-mm x 3-mm QFN Package

2 Applications

- White LED Drivers
- Cellular Phones
- PDAs, Pocket PCs, and Smart Phones
- Digital Still Cameras
- Handheld Devices

3 Description

The TPS6106x is a high-frequency, synchronous boost converter with constant current output to drive up to five white LEDs. For maximum safety, the device features integrated overvoltage and an advanced short-circuit protection when the output is shorted to ground. The device operates with 1-MHz fixed switching frequency to allow for the use of small external components and to simplify possible EMI problems. The device comes with three different overvoltage protection thresholds (14 V, 18 V, and 23 V) to allow inexpensive and small-output capacitors with lower voltage ratings. The LED current is initially set with the external sense resistor R_S , and the feedback voltage is regulated to 500 mV or 250 mV, depending on the configuration of the ILED pin. Digital brightness control is implemented by applying a simple digital signal to the ILED pin. Alternatively, a PWM signal up to 1 kHz can be applied to the enable pin to control the brightness of the LED. During shutdown, the output is disconnected from the input to avoid leakage current through the LEDs.

Pin Functions

NAME	PIN		I/O	DESCRIPTION
	CSP	NO.		
VIN	B1	8	I	Input supply pin of the device
EN	A2	2	I	Enable pin. This pin needs to be pulled high to enable the device. To allow brightness control of the LEDs, a PWM signal up to 1 kHz can be applied. This pin has an internal pulldown resistor.
GND	A1	1		Analog ground
PGND	C3	5		Power ground
FB	B3	4	I	This is the feedback pin of the device. The feedback pin regulates the LED current through the sense resistor by regulating the voltage across Rs. The feedback voltage is set by the ILED pin. ILED=GND sets the feedback voltage to 500 mV. ILED=high sets the feedback voltage to 250 mV. Refer to digital brightness control section for more information.
OUT	C1	7	O	Output of the device

Pin Functions (continued)

PIN		I/O	DESCRIPTION	
NAME	NO.			
	CSP			QFN
SW	C2	6	I	Switch pin of the device
ILED	A3	3	I	Digital brightness control input. When this pin is grounded, the digital brightness control is disabled. When this pin is connected to high, then the feedback voltage is reduced to typically 250 mV and the digital brightness control is enabled. Refer to digital brightness control section for more information.
PowerPAD™	–	–		The PowerPAD™ (exposed thermal diepad) is only available on the QFN package. The PowerPAD™ needs to be connected and soldered to analog ground (GND).

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _{IN} ⁽²⁾	Supply voltages on pin	–0.3	7	V
EN, ILED, FB ⁽²⁾	Voltages on pins	–0.3	7	V
OUT ⁽²⁾	Voltage on pin		33	V
SW ⁽²⁾	Voltage on pin		33	V
	Operating junction temperature	–40	150	°C
	Lead temperature (soldering, 10 s)		260	°C
T _{stg}	Storage temperature	–55	150	°C

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Recommended Operating Conditions](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±750

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

		MIN	TYP	MAX	UNIT
V _I	Input voltage range	2.7		6.0	V
L	Inductor ⁽¹⁾		22		μH
C _I	Input capacitor ⁽¹⁾		1		μF

8 Detailed Description

8.1 Overview

The TPS61060/61/62 family is a constant-frequency, PWM current-mode converter with an integrated N-channel MOSFET switch and synchronous P-channel MOSFET rectifier. The device operates in pulse width modulation (PWM) with a fixed switching frequency of 1 MHz. For an understanding of the device operation, refer the block diagram. The duty cycle of the converter is set by the error amplifier and the sawtooth ramp applied to the comparator. Because the control architecture is based on a current-mode control, a compensation ramp is added to allow stable operation for duty cycles larger than 50%. The converter is a fully integrated synchronous boost converter operating always in continuous conduction mode. This allows low noise operation and avoids ringing on the switch pin as it would be seen on a converter when entering discontinuous conduction mode.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Start-Up

To avoid high inrush current during start-up, special care is taken to control the inrush current. When the device is first enabled, the output capacitor is charged with a constant precharge current of typically 100 mA until the output voltage is typically 0.3 V below V_{IN} . The device starts with a reduced analog controlled current limit for typically 40 μs . After this time, the device enters its normal regulation with full current limit. The fixed precharge current during start-up allows the device to start up without problems when driving LEDs because the LED only starts to conduct current when the forward voltage is reached. If, for any reason a resistive load is driven, the maximum start-up load current must be smaller, or equal to, the precharge current.

Feature Description (continued)

8.3.2 Short-Circuit Protection

The TPS6106x family has an advanced short-circuit protection in case the output of the device is shorted to ground. Because the device is configured as a current source even when the LEDs are shorted, the maximum current is controlled by the sense resistor R_s . As an additional safety feature, the TPS6106x series also protects the device and inductor when the output is shorted to ground. When the output is shorted to ground, the device enters precharge mode and limits the maximum current to typically 100 mA.

8.3.3 Overvoltage Protection (OVP)

As with any current source, the output voltage rises when the output gets high impedance or disconnected. To prevent the output voltage exceeding the maximum switch voltage rating (33 V) of the main switch, an overvoltage protection circuit is integrated. As soon as the output voltage exceeds the OVP threshold, the converter stops switching and the output voltage falls down. When the output voltage falls below the OVP threshold, the converter continues operation until the output voltage exceeds the OVP threshold again. To allow the use of inexpensive low-voltage output capacitors, the TPS6106x series has different OVP levels that must be selected according to the number of external LEDs and their maximum forward voltage.

8.3.4 Efficiency and Feedback Voltage

The feedback voltage has a direct effect on the converter efficiency. Because the voltage drop across the feedback resistor does not contribute to the output power (LED brightness), the lower the feedback voltage, the higher the efficiency. Especially when powering only three or less LEDs, the feedback voltage impacts the efficiency around 2% depending on the sum of the forward voltage of the LEDs. To take advantage of this, the ILED pin can be connected to VIN, setting the feedback voltage to 250 mV.

8.3.5 Undervoltage Lockout

An undervoltage lockout prevents mis-operation of the device at input voltages below typical 1.65 V. When the input voltage is below the undervoltage threshold, the device remains off and both internal MOSFETs are turned off providing isolation between input and output.

8.3.6 Thermal Shutdown

An internal thermal shutdown is implemented and turns off the internal MOSFETs when the typical junction temperature of 160°C is exceeded. The thermal shutdown has a hysteresis of typically 15°C.

8.4 Device Functional Modes

8.4.1 Enable PWM Dimming

The EN pin allows disabling and enabling of the device as well as brightness control of the LEDs by applying a PWM signal up to typically 1 kHz. When a PWM signal is applied, the LED current is turned on when the EN is high and off when EN is pulled low. Changing the PWM duty cycle therefore changes the LED brightness. To allow higher PWM frequencies on the enable pin, the device continues operation when a PWM signal is applied. As shown in the block diagram, the EN pin needs to be pulled low for at least 50 ms to fully turn the device off. The enable input pin has an internal 300-k Ω pulldown resistor to disable the device when this pin is floating.

8.4.2 Digital Brightness Control (ILED)

The ILED pin features a simple digital interface to allow digital brightness control. This can save processor power and battery life. Using the digital interface to control the LED brightness does not require a PWM signal all the time, and the processor can enter sleep mode if available. To save signal lines, the ILED pin can be connected to the enable pin to allow digital programming and enable/disable function at the same time with the same signal. Such a circuit is shown in [Figure 9](#).

Device Functional Modes (continued)

The ILED pin basically sets the feedback regulation voltage (V_{FB}); thus, it sets the LED current. When the ILED pin is connected to GND, the digital brightness control is disabled and the feedback is regulated to $V_{FB} = 500$ mV. When the ILED pin is pulled high, the digital brightness control is enabled starting at its midpoint where the feedback is regulated to $V_{FB} = 250$ mV. The digital brightness control is implemented by adjusting the feedback voltage in digital steps with a typical maximum voltage of $V_{FB} = 500$ mV. For this purpose, a 5-bit DAC is used giving 32 steps equal to a 15.6-mV change in feedback voltage per step. To increase or decrease the internal reference voltage, the ILED pin needs to be pulled low over time as outlined in Table 2 and specified in the electrical table. When the internal DAC is programmed to its highest or lowest value, it stays at this value until it gets programmed in the opposite direction again.

Table 2. Increase/Decrease Internal Reference Voltage

FEEDBACK VOLTAGE	TIME	ILED LOGIC LEVEL
Increase	1 μ s to 75 μ s	Low
Decrease	180 μ s to 300 μ s	Low
Brightness control disabled	≥ 550 μ s	Low
Delay between steps	1.5 μ s	High

Between each cycle the ILED pin needs to be pulled high for 1.5 μ s.

Figure 9. ILED Timing Diagram

Using the digital interface on the ILED pin allows simple implementation of a two-step brightness control by pulling the ILED either high or low. For full LED current with $V_{FB} = 500$ mV, the ILED must be pulled low; to program half the LED current with $V_{FB} = 250$ mV, the ILED pin must be pulled high.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TPS6106x is designed to driver up to five LEDs in series with constant current output. The device, which operates in peak current mode PWM control, has a switch peak current limit of 325-mA minimum and internal loop compensation. The switching frequency is fixed at 1 MHz, and the input voltage range is 2.7 to 6.0 V. The following section provides a step-by-step design approach for configuring the TPS61060 to power two white LEDs in series.

9.2 Typical Application

Figure 10. TPS61062 Powering Five White LEDs

9.2.1 Design Requirements

PARAMETER	VALUE
Input Voltage	3 V to 6 V
Output Current	20 mA

9.2.2 Detailed Design Procedure

9.2.2.1 Inductor Selection

The device requires typically a 22-µH or 10-µH inductance. When selecting the inductor, the inductor saturation current should be rated as high as the peak inductor current at maximum load, and respectively, maximum LED current. Because of the special control loop design, the inductor saturation current does not need to be rated for the maximum switch current of the converter. The maximum converter switch current usually is not reached even when the LED current is pulsed by applying a PWM signal to the enable pin. The maximum inductor peak current, as well as LED current, is calculated as:

$$\text{Duty cycle : } D = 1 - \frac{V_{in}}{V_{out}} \quad (1)$$

$$\text{Maximum LED current : } I_{LED} = \left(I_{sw} - \frac{V_{in} \times D}{2 \times f_s \times L} \right) \times (1 - D) \times \eta \quad (2)$$

$$\text{Inductor peak current : } I_{L,peak} = \frac{V_{in} \times D}{2 \times f_s \times L} + \frac{I_{LED}}{(1 - D) \times \eta} \quad (3)$$

with:

f_s = Switching frequency (1 MHz typical)

L = Inductor value

η = Estimated converter efficiency (0.75)

I_{sw} = Minimum N-channel MOSFET current limit (325 mA)

(4)

Using the expected converter efficiency is a simple approach to calculate maximum possible LED current as well as peak inductor current. The efficiency can be estimated by taking the efficiency numbers out of the provided efficiency curves or to use a worst-case assumption for the expected efficiency, for example, 75%.

9.2.2.2 Efficiency

The overall efficiency of the application depends on the specific application conditions and mainly on the selection of the inductor. A physically smaller inductor usually shows lower efficiency due to higher switching losses of the inductor (core losses, proximity losses, skin effect losses). A trade-off between physical inductor size and overall efficiency has to be made. The efficiency can typically vary around $\pm 5\%$ depending on the selected inductor. Figure 2 to Figure 7 can be used as a guideline for the application efficiency. These curves show the typical efficiency with a 22- μH inductor (Murata Electronics LQH32CN220K23). Figure 11 shows a basic setup where the efficiency is taken/measured as:

$$\eta = \frac{V_{LED} \times I_{LED}}{V_{in} \times I_{in}} \quad (5)$$

Table 3. Inductor Selection

22 μH	Murata LQH32CN220K23	3.2 mm \times 2.5 mm \times 2.0 mm

Figure 11. Efficiency Measurement Setup

9.2.2.3 Output Capacitor Selection

The device is designed to operate with a fairly wide selection of ceramic output capacitors. The selection of the output capacitor value is a trade-off between output voltage ripple and capacitor cost and form factor. In general, capacitor values of 220 nF up to 4.7 μ F can be used. When using a 220-nF output capacitor, it is recommended to use X5R or X7R dielectric material to avoid the output capacitor value falling far below 220 nF over temperature and applied voltage. For systems with wireless or RF sections, EMI is always a concern. To minimize the voltage ripple in the LED string and board traces, the output capacitor needs to be connected directly from the OUT pin of the device to ground rather than across the LEDs. A larger output capacitor value reduces the output voltage ripple. Table 4 shows possible input and/or output capacitors.

9.2.2.4 Input Capacitor Selection

For good input voltage filtering, low ESR ceramic capacitors are recommended. A 1- μ F ceramic input capacitor is sufficient for most of the applications. For better input voltage filtering and EMI reduction, this value can be increased. The input capacitor should be placed as close as possible to the input pin of the converter. Table 4 shows possible input and/or output capacitors.

Table 4. Capacitor Selection

CAPACITOR	VOLTAGE RATING	FORM FACTOR	COMPONENT SUPPLIER ⁽¹⁾	COMMENTS
INPUT CAPACITOR				
1 μ F	10 V	0603	Tayo Yuden LMK107BJ105

Figure 21. TPS61061 Digital Brightness Control

10 Power Supply Recommendations

The TPS6106x is designed to operate from an input voltage supply range from 2.7-V to 6.0-V. The power supply to the TPS6106x must have a current rating according to the supply voltage, output voltage, and output current of the TPS6106x device.

11 Layout

11.1 Layout Guidelines

As for all switching power supplies, the layout is an important step in the design, especially at high peak currents and switching frequencies. If the layout is not carefully done, the regulator might show noise problems and duty cycle jitter. The input capacitor should be placed as close as possible to the input pin for good input voltage filtering. The inductor should be placed as close as possible to the switch pin to minimize the noise coupling into other circuits. The output capacitor needs to be placed directly from the OUT pin to GND rather than across the LEDs. This reduces the ripple current in the trace to the LEDs. The GND pin must be connected directly to the PGND pin. When doing the PCB layout, the bold traces ([Figure 22](#)) should be routed first, as well as placement of the inductor, and input and output capacitors.

11.2 Layout Example

Figure 22. TPS6106x Layout Example

11.3 Thermal Considerations

The TPS6106x comes in a thermally enhanced QFN package. The package includes a thermal pad that improves the thermal capabilities of the package. Also see *QFN/SOP PCB Attachment* application report ([SLUA271](#)). The thermal resistance junction-to-ambient $R_{\theta JA}$ of the QFN package greatly depends on the PCB layout. Using thermal vias and wide PCB traces improves the thermal resistance $R_{\theta JA}$. The thermal pad must be soldered to the analog ground on the PCB.

For the NanoFree package, similar guidelines apply for the QFN package. The thermal resistance $R_{\theta JA}$ depends mainly on the PCB layout.

12 Device and Documentation Support

12.1 Device Support

12.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

12.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

Table 5. Related Links

12.3 Trademarks

NanoFree, PowerPAD are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

13.1 Chipscale Package Dimensions

The TPS6106x is available in a Chipscale package and has the following mechanical dimensions: E=D=1,446 mm (typical), E=D=1,424 mm (minimum), E=D=1,5 mm (maximum). See the mechanical drawing of the package (YZF).

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - Small Outline No-Lead (SON) package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

THERMAL PAD MECHANICAL DATA

DRB (S-PVSON-N8)

PLASTIC SMALL OUTLINE NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

DRB (S-PVSON-N8)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for solder mask tolerances.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
