## HEF4047B <br> MSI <br> Monostable/astable multivibrator

Product specification
File under Integrated Circuits, IC04

PHILIPS

## DESCRIPTION

The HEF4047B consists of a gatable astable multivibrator with logic techniques incorporated to permit positive or negative edge-triggered monostable multivibrator action with retriggering and external counting options.
Inputs include + TRIGGER, - TRIGGER, ASTABLE, ASTABLE, RETRIGGER and MR (Master Reset).
Buffered outputs are $\mathrm{O}, \overline{\mathrm{O}}$ and OSCILLATOR OUTPUT. In all modes of operation an external capacitor $\left(\mathrm{C}_{\mathrm{t}}\right)$ must be connected between $\mathrm{C}_{\mathrm{TC}}$ and $\mathrm{RC}_{\mathrm{TC}}$, and an external resistor $\left(R_{t}\right)$ must be connected between $R_{T C}$ and $R C_{T C}$ (continued on next page).

Fig. 1 Functional diagram.

## Monostable/astable multivibrator

Astable operation is enabled by a HIGH level on the ASTABLE input. The period of the square wave at $O$ and $\overline{\mathrm{O}}$ outputs is a function of the external components employed. 'True' input pulses on the ASTABLE or 'complement' pulses on the ASTABLE input, allow the circuit to be used as a gatable multivibrator. The OSCILLATOR OUTPUT period will be half of the O output in the astable mode. However, a $50 \%$ duty factor is not guaranteed at this output.

In the monostable mode, positive edge-triggering is accomplished by applying a leading-edge pulse to the + TRIGGER input and a LOW level to the - TRIGGER input. For negative edge-triggering, a trailing-edge pulse is applied to the - TRIGGER and a HIGH level to the + TRIGGER. Input pulses may be of any duration relative to the output pulse. The multivibrator can be retriggered (on the leading-edge only) by applying a common pulse to both the RETRIGGER and + TRIGGER inputs. In this mode the output pulse remains HIGH as long as the input pulse period is shorter than the period determined by the RC components.

Fig. 2 Pinning diagram.

An external count down option can be implemented by coupling O to an external ' N ' counter and resetting the counter with the trigger pulse. The counter output pulse is fed back to the ASTABLE input and has a duration equal to N times the period of the multivibrator. A HIGH level on the MR input assures no output pulse during an ON-power condition. This input can also be activated to terminate the output pulse at any time. In the monostable mode, a HIGH level or power-ON reset pulse must be applied to MR, whenever $\mathrm{V}_{\mathrm{DD}}$ is applied.

## APPLICATION INFORMATION

## General features:

- Monostable (one-shot) or astable (free-running) operation
- True and complemented buffered outputs
- Only one external R and C required

## Monostable multivibrator features:

- Positive- or negative-edge triggering
- Output pulse width independent of trigger pulse duration
- Retriggerable option for pulse-width expansion
- Long pulse width possible using small RC components by means of external counter provision
- Fast recovery time essentially independent of pulse width
- Pulse-width accuracy maintained at duty cycles approaching 100\%

## Astable multivibrator features:

- Free-running or gatable operating modes
- $50 \%$ duty cycle
- Oscillator output available

## 1. Astable mode design information

a. Unit-to-unit transfer-voltage variations

The following analysis presents worst-case variations from unit-to-unit as a function of transfer-voltage ( $\mathrm{V}_{\mathrm{TR}}$ ) shift for free running (astable) operation.

Fig. 4 Astable mode waveforms.
$t_{1}=-R_{t} C_{t} \ln \frac{V_{T R}}{V_{D D}+V_{T R}}$
$t_{2}=-R_{t} C_{t} \ln \frac{V_{D D}-V_{T R}}{2 V_{D D}-V_{T R}}$
$t_{A}=2\left(t_{1}+t_{2}\right)=-2 R_{t} C_{t} \ln \frac{\left(V_{T R}\right)\left(V_{D D}-V_{T R}\right)}{\left(V_{D D}+V_{T R}\right)\left(2 V_{D D}-V_{T R}\right)}$, where $t_{A}=$ Astable mode pulse width.

Values for $t_{A}$ are:

|  | typ. : | $\mathrm{V}_{\mathrm{TR}}=0,5 \mathrm{~V}_{\mathrm{DD}} ;$ | $\mathrm{t}_{\mathrm{A}}=4,40 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{DD}}=5$ or 10 V | min. : | $\mathrm{V}_{\mathrm{TR}}=0,3 \mathrm{~V}_{\mathrm{DD}} ;$ | $\mathrm{t}_{\mathrm{A}}=4,71 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |
|  | max.: | $\mathrm{V}_{\mathrm{TR}}=0,7 \mathrm{~V}_{\mathrm{DD}} ;$ | $\mathrm{t}_{\mathrm{A}}=4,71 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |
| $\mathrm{V}_{\mathrm{DD}}=15 \mathrm{~V}$ | min. : | $\mathrm{V}_{\mathrm{TR}}=4 \mathrm{~V} ;$ | $\mathrm{t}_{\mathrm{A}}=4,84 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |
|  | max.: | $\mathrm{V}_{\mathrm{TR}}=11 \mathrm{~V} ;$ | $\mathrm{t}_{\mathrm{A}}=4,84 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |

thus if $\mathbf{t}_{\mathbf{A}}=\mathbf{4 , 4 0} \mathbf{R}_{\mathbf{t}} \mathbf{C}_{\mathbf{t}}$ is used, the maximum variation will be (+7,0\%; $-0,0 \%$ ) at 10 V .

## b. Variations due to changes in $V_{D D}$

In addition to variations from unit-to-unit, the astable period may vary as a function of frequency with respect to $V_{D D}$. Typical variations are presented graphically in Figs 5 and 6 with 10 V as a reference.

Fig. 5 Typical O and $\overline{\mathrm{O}}$ period accuracy as a function of supply voltage; astable mode; $\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$.

| CURVE | $\|c\| c$ <br> $\mathbf{f}_{\mathbf{0}}$ <br> $\mathbf{k H z}$ | $\mathbf{C}_{\mathbf{t}}$ <br> $\mathbf{p F}$ | $\mathbf{R}_{\mathbf{t}}$ <br> $\mathbf{k} \boldsymbol{\Omega}$ |
| :---: | ---: | ---: | :---: |
| A | 10 | 100 | 220 |
| B | 5 | 100 | 470 |
| C | 1 | 1000 | 220 |

Fig. 6 Typical O and $\overline{\mathrm{O}}$ period accuracy as a function of supply voltage; astable mode; $\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$.

| CURVE | $\mathbf{f}_{\mathbf{O}}$ <br> $\mathbf{k H z}$ | $\mathbf{C}_{\mathbf{t}}$ <br> $\mathbf{p F}$ | $\mathbf{R}_{\mathbf{t}}$ <br> $\mathbf{k} \Omega$ |
| :---: | :---: | :---: | :---: |
| A | 500 | 10 | 47 |
| B | 225 | 100 | 10 |
| C | 100 | 100 | 22 |
| D | 50 | 100 | 47 |

## Monostable/astable multivibrator

## 2. Monostable mode design information

The following analysis presents worst case variations from unit-to-unit as a function of transfer-voltage $\left(\mathrm{V}_{\mathrm{TR}}\right)$ shift for one-shot (monostalbe) operation.

Fig. 7 Monostable waveforms.

$$
\begin{aligned}
& t_{1}^{\prime}=-R_{t} C_{t} \ln \frac{V_{T R}}{2 V_{D D}} \\
& t_{M}=\left(t_{1} \prime^{\prime}+t_{2}\right) \\
& t_{M}=-R_{t} C_{t} \ln \frac{\left(V_{T R}\right)\left(V_{D D}-V_{T R}\right)}{\left(2 V_{D D}-V_{T R}\right)\left(2 V_{D D}\right)}, \text { where } t_{M}=\text { Monostable mode pulse width. }
\end{aligned}
$$

Values for $\mathrm{t}_{\mathrm{M}}$ are:

|  | typ. : | $\mathrm{V}_{\mathrm{TR}}=0,5 \mathrm{~V}_{\mathrm{DD}} ;$ | $\mathrm{t}_{\mathrm{M}}=2,48 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{DD}}=5$ to 10 V | min. $:$ | $\mathrm{V}_{\mathrm{TR}}=0,3 \mathrm{~V}_{\mathrm{DD}} ;$ | $\mathrm{t}_{\mathrm{M}}=2,78 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |
|  | max.: | $\mathrm{V}_{\mathrm{TR}}=0,7 \mathrm{~V}_{\mathrm{DD}} ;$ | $\mathrm{t}_{\mathrm{M}}=2,52 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |
| $\mathrm{V}_{\mathrm{DD}}=15 \mathrm{~V}$ | min. $:$ | $\mathrm{V}_{\mathrm{TR}}=4 \mathrm{~V} ;$ | $\mathrm{t}_{\mathrm{M}}=2,88 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |
|  | max.: | $\mathrm{V}_{\mathrm{TR}}=11 \mathrm{~V} ;$ | $\mathrm{t}_{\mathrm{M}}=2,56 \mathrm{R}_{\mathrm{t}} \mathrm{C}_{\mathrm{t}}$ |

## Note

1. In the astable mode, the first positive half cycle has a duration of $t_{M}$; succeeding durations are $1 / 2 t_{A}$.
thus if $\mathbf{t}_{\mathbf{M}}=\mathbf{2 , 4 8} \mathbf{R}_{\mathbf{t}} \mathbf{C}_{\mathbf{t}}$ is used, the maximum variation will be $(+12 \% ;-0,0 \%)$ at 10 V .

## 3. Retrigger mode operation

The HEF4047B can be used in the retrigger mode to extend the output pulse duration, or to compare the frequency of an input signal with that of the internal oscillator. In the retrigger mode the input pulse is applied to pins 8 and 12, and the output is taken from pin 10 or 11. Normal monostable action is obtained when one retrigger pulse is applied (Fig.8). Extended pulse duration is obtained when more than one pulse is applied. For two input pulses, $t_{R E}=t_{1}{ }^{\prime}+t_{1}+2 t_{2}$. For more than two pulses, $t_{R E}$ (output $O$ ), terminates at some variable time, $t_{D}$, after the termination of the last retrigger pulse; $t_{D}$ is variable because $t_{R E}$ (output $O$ ) terminates after the second positive edge of the oscillator output appears at flip-flop 4.

Fig. 8 Retrigger mode waveforms.

## 4. External counter option

Time $t_{M}$ can be extended by any amount with the use of external counting circuitry. Advantages include digitally controlled pulse duration, small timing capacitors for long time periods, and extremely fast recovery time. A typical implementation is shown in Fig.9.
The pulse duration at the output is: $t_{\text {ext }}=(N-1)\left(t_{A}\right)+\left(t_{M}+1 / 2 t_{A}\right)$
Where $t_{\text {ext }}=$ pulse duration of the circuitry, and $N$ is the number of counts used.

Fig. 9 Implementation of external counter option.

## 5. Timing component limitations

The capacitor used in the circuit should be non-polarized and have low leakage (i.e. the parallel resistance of the capacitor should be an order of magnitude greater than the external resistor used).
There is no upper or lower limit for either $R_{t}$ or $C_{t}$ value to maintain oscillation.
However, in consideration of accuracy, $C_{t}$ must be much larger than the inherent stray capacitance in the system (unless this capacitance can be measured and taken into account).
$R_{t}$ must be much larger than the LOCMOS 'ON' resistance in series with it, which typically is hundreds of ohms.
The recommended values for $R_{t}$ and $C_{t}$ to maintain agreement with previously calculated formulae without trimming should be:
$C_{t} \geq 100 \mathrm{pF}$, up to any practical value, $10 \mathrm{k} \Omega \leq \mathrm{R}_{\mathrm{t}} \leq 1 \mathrm{M} \Omega$.

## 6. Power consumption

In the standby mode (monostable or astable), power dissipation will be a function of leakage current in the circuit. For dynamic operation, the power needed to charge the external timing capacitor $\mathrm{C}_{\mathrm{t}}$ is given by the following formulae:

| Astable mode: | $P=2 C_{t} V^{2} f(f$ at output pin 13) |
| :--- | :--- |
|  | $P=4 C_{t} V^{2} f(f$ at output pins 10 and 11) |

Monostable mode: $\quad P=\frac{\left(2,9 C_{t} V^{2}\right) \text { (duty cycle) }}{T}$ (f at output pins 10 and 11)

Because the power dissipation does not depend on $R_{t}$, a design for minimum power dissipation would be a small value of $C_{t}$. The value of $R$ would depend on the desired period (within the limitations discussed previously).
Typical power consumption in astable mode is shown in Figs 10, 11 and 12.

Fig. 10 Power consumption as a function of the output frequency at O or $\overline{\mathrm{O}} ; \mathrm{V}_{\mathrm{DD}}=5 \mathrm{~V}$; astable mode.

Fig. 11 Power consumption as a function of the output frequency at O or $\overline{\mathrm{O}} ; \mathrm{V}_{\mathrm{DD}}=10 \mathrm{~V}$; astable mode.

Monostable/astable multivibrator

Fig. 12 Power consumption as a function of the output frequency at O or $\overline{\mathrm{O}} ; \mathrm{V}_{\mathrm{DD}}=15 \mathrm{~V}$; astable mode.
