

CC1120 High-Performance RF Transceiver for Narrowband Systems

1 Device Overview

1.1 Features

- High-Performance, Single-Chip Transceiver
 - Adjacent Channel Selectivity:
 - 64 dB at 12.5-kHz Offset
 - Blocking Performance: 91 dB at 10 MHz
 - Excellent Receiver Sensitivity:
 - –123 dBm at 1.2 kbps
 - –110 dBm at 50 kbps
 - –127 dBm Using Built-in Coding Gain
 - Very Low Phase Noise:
 - 111 dBc/Hz at 10-kHz Offset
- Suitable for Systems Targeting ETSI Category 1 Compliance in 169-MHz and 433-MHz Bands
- High Spectral Efficiency (9.6 kbps in 12.5-kHz Channel in Compliance With FCC Narrowbanding Mandate)
- Separate 128-Byte RX and TX FIFOs
- Support for Seamless Integration With the CC1190 Device for Increased Range Giving up to 3-dB Improvement in Sensitivity and up to +27-dBm Output Power
- Power Supply
 - Wide Supply Voltage Range (2.0 V to 3.6 V)
 - Low Current Consumption:
 - RX: 2 mA in RX Sniff Mode
 - RX: 17 mA Peak Current in Low-Power Mode
 - RX: 22 mA Peak Current in High-Performance Mode
 - TX: 45 mA at +14 dBm
 - Power Down: 0.12 μ A (0.5 μ A With eWOR Timer Running)
- Programmable Output Power up to +16 dBm With 0.4-dB Step Size
- Automatic Output Power Ramping
- Configurable Data Rates: 0 to 200 kbps
- Supported Modulation Formats: 2-FSK, 2-GFSK, 4-FSK, 4-GFSK, MSK, OOK
- WaveMatch: Advanced Digital Signal Processing for Improved Sync Detect Performance
- RoHS-Compliant 5-mm x 5-mm No-Lead QFN 32-Pin Package (RHB)
- Regulations – Suitable for Systems Targeting Compliance With
 - **Europe:** ETSI EN 300 220, ETSI EN 54-25
 - **US:** FCC CFR47 Part 15, FCC CFR47 Part 90, 24, and 101
 - **Japan:** ARIB RCR STD-T30, ARIB STD-T67, ARIB STD-T108
- Peripherals and Support Functions
 - Enhanced Wake-On-Radio (eWOR) Functionality for Automatic Low-Power Receive Polling
 - Includes Functions for Antenna Diversity Support
 - Support for Retransmissions
 - Support for Automatic Acknowledge of Received Packets
 - TCXO Support and Control, Also in Power Modes
 - Automatic Clear Channel Assessment (CCA) for Listen-Before-Talk (LBT) Systems
 - Built-in Coding Gain Support for Increased Range and Robustness
 - Digital RSSI Measurement
 - Temperature Sensor

1.2 Applications

- Narrowband Ultra-Low-Power Wireless Systems With Channel Spacing Down to 12.5 kHz
- 169-, 315-, 433-, 868-, 915-, 920-, 950-MHz ISM/SRD Band
- Wireless Metering and Wireless Smart Grid (AMR and AMI)
- IEEE 802.15.4g Systems
- Home and Building Automation
- Wireless Alarm and Security Systems
- Industrial Monitoring and Control
- Wireless Healthcare Applications
- Wireless Sensor Networks and Active RFID
- Private Mobile Radios

1.3 Description

The CC1120 device is a fully integrated single-chip radio transceiver designed for high performance at very low-power and low-voltage operation in cost-effective wireless systems. All filters are integrated, thus removing the need for costly external SAW and IF filters. The device is mainly intended for Industrial, Scientific, and Medical (ISM) applications and Short Range Device (SRD) frequency bands at 164 to 192 MHz, 274 to 320 MHz, 410 to 480 MHz, and 820 to 960 MHz.

The CC1120 device provides extensive hardware support for packet handling, data buffering, burst transmissions, clear channel assessment, link quality indication, and wake-on-radio. The main operating parameters of the CC1120 device can be controlled through an SPI interface. In a typical system, the CC1120 device is used with a microcontroller and only a few external passive components.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
CC1120	VQFN (32)	5.00 mm x 5.00 mm

(1) For more information, see [Section 8, Mechanical Packaging and Orderable Information](#)

1.4 Functional Block Diagram

Figure 1-1 shows the system block diagram of the CC1120 device.

2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision G (September 2014) to Revision H	Page
• Moved storage temperature range back to <i>Absolute Maximum Ratings</i> table	7
• Updated the formatting of the <i>Specifications</i> section	7
• Changed clock frequency minimum value FROM: 32 MHz TO: 31.25 MHz in <i>32-MHz Clock Input (TCXO)</i>	14
• Added clock frequency typical value of 32 MHz to <i>32-MHz Clock Input (TCXO)</i>	14
• Changed crystal frequency minimum value FROM: 32 MHz TO: 31.25 MHz in the <i>32-MHz Crystal Oscillator</i> table .	14
• Added crystal frequency typical value of 32 MHz in the <i>32-MHz Crystal Oscillator</i> table	14
• Changed table title FROM: <i>Wakeup and Timing</i> TO: <i>Timing Requirements</i>	16

Changes from Revision F (July 2014) to Revision G	Page
• Added "Ambient" to the temperature range condition and removed T _j from Temperature range	7
• Added data to TCXO table	14

3 Terminal Configuration and Functions

3.1 Pin Diagram

Figure 3-1 shows pin names and locations for the CC1120 device.

Figure 3-1. Package 5-mm x 5-mm QFN

3.2 Pin Configuration

The following table lists the pinout configuration for the CC1120 device.

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	VDD_GUARD	Power	2.0–3.6 V VDD
2	RESET_N	Digital input	Asynchronous, active-low digital reset
3	GPIO3	Digital I/O	General-purpose I/O
4	GPIO2	Digital I/O	General-purpose I/O
5	DVDD	Power	2.0–3.6 VDD to internal digital regulator
6	DCPL	Power	Digital regulator output to external decoupling capacitor
7	SI	Digital input	Serial data in
8	SCLK	Digital input	Serial data clock
9	SO(GPIO1)	Digital I/O	Serial data out (general-purpose I/O)
10	GPIO0	Digital I/O	General-purpose I/O
11	CSn	Digital input	Active-low chip select
12	DVDD	Power	2.0–3.6 V VDD
13	AVDD_IF	Power	2.0–3.6 V VDD
14	RBIAS	Analog	External high-precision resistor
15	AVDD_RF	Power	2.0–3.6 V VDD
16	N.C.	—	Not connected
17	PA	Analog	Single-ended TX output (requires DC path to VDD)
18	TRX_SW	Analog	TX and RX switch. Connected internally to GND in TX and floating (high-impedance) in RX.
19	LNA_P	Analog	Differential RX input (requires DC path to ground)
20	LNA_N	Analog	Differential RX input (requires DC path to ground)
21	DCPL_VCO	Power	Pin for external decoupling of VCO supply regulator
22	AVDD_SYNT1	Power	2.0–3.6 V VDD
23	LPF0	Analog	External loop filter components
24	LPF1	Analog	External loop filter components
25	AVDD_PFD_CHP	Power	2.0–3.6 V VDD
26	DCPL_PFD_CHP	Power	Pin for external decoupling of PFD and CHP regulator
27	AVDD_SYNT2	Power	2.0–3.6 V VDD
28	AVDD_XOSC	Power	2.0–3.6 V VDD
29	DCPL_XOSC	Power	Pin for external decoupling of XOSC supply regulator
30	XOSC_Q1	Analog	Crystal oscillator pin 1 (must be grounded if a TCXO or other external clock connected to EXT_XOSC is used)
31	XOSC_Q2	Analog	Crystal oscillator pin 2 (must be left floating if a TCXO or other external clock connected to EXT_XOSC is used)
32	EXT_XOSC	Digital input	Pin for external clock input (must be grounded if a regular crystal connected to XOSC_Q1 and XOSC_Q2 is used)
—	GND	Ground pad	The ground pad must be connected to a solid ground plane.

4 Specifications

All measurements performed on CC1120EM_868_915 rev.1.0.1, CC1120EM_955 rev.1.2.1, CC1120EM_420_470 rev.1.0.1, or CC1120EM_169 rev.1.2.

Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Supply voltage (VDD, AVDD_x)	All supply pins must have the same voltage	-0.3	3.9	V
Input RF level			+10	dBm
Voltage on any digital pin	Max 3.9 V	-0.3	VDD + 0.3	V
Voltage on analog pins (including DCPL pins)		-0.3	2.0	V
Storage temperature, T _{stg}		-40	125	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under general characteristics is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS} unless otherwise noted.

4.1 ESD Ratings

		VALUE	UNIT
V _{ESD}	Electrostatic discharge (ESD) performance	Human body model (HBM), per ANSI/ESDA/JEDEC JS001 ⁽¹⁾	±2 kV
		Charged device model (CDM), per JESD22-C101 ⁽²⁾	All pins ±500 V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V HBM allows safe manufacturing with a standard ESD control process.

4.2 Recommended Operating Conditions (General Characteristics)

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Voltage supply range	All supply pins must have the same voltage	2.0		3.6	V
Voltage on digital inputs		0		VDD	V
Ambient temperature range		-40		85	°C

4.3 RF Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Frequency bands		820		960	MHz
		410		480	
	See SWRA398 , Using the CC112x/CC1175 at 274 to 320 MHz, for more information	(273.3)		(320)	
		164		192	
	Contact TI for more information about the use of these frequency bands	(205) (136.7)		(240) (160)	
Frequency resolution	In 820–950 MHz band		30		Hz
	In 410–480 MHz band		15		
	In 164–192 MHz band		6		
Data rate	Packet mode	0		200	kbps
	Transparent mode	0		100	
Data rate step size			1e-4		bps

4.4 Power Consumption Summary

$T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$ if nothing else stated

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
CURRENT CONSUMPTION: STATIC MODES						
Power down with retention				0.12	1	μA
		Low-power RC oscillator running		0.5		
XOFF mode		Crystal oscillator / TCXO disabled		170		μA
IDLE mode		Clock running, system waiting with no radio activity		1.3		mA
CURRENT CONSUMPTION, TRANSMIT MODES						
TX current consumption +10 dBm		950-MHz band (high-performance mode)		37		mA
TX current consumption 0 dBm				26		mA
TX current consumption +14 dBm		868-, 915-, and 920-MHz bands (high-performance mode)		45		mA
TX current consumption +10 dBm				34		mA
TX current consumption +15 dBm		434-MHz band (high-performance mode)		50		mA
TX current consumption +14 dBm				45		mA
TX current consumption +10 dBm				34		mA
TX current consumption +15 dBm				54		mA
TX current consumption +14 dBm		169-MHz band (high-performance mode)		49		mA
TX current consumption +10 dBm				41		mA
LOW-POWER MODE⁽¹⁾						
TX current consumption +10 dBm				32		mA
CURRENT CONSUMPTION, RECEIVE MODE (HIGH-PERFORMANCE MODE)⁽¹⁾						
RX wait for sync	1.2 kbps, 4-byte preamble	Using RX sniff mode, where the receiver wakes up at regular intervals to look for an incoming packet ⁽²⁾		2		mA
	38.4 kbps, 4-byte preamble			13.4		
RX peak current	433-, 868-, 915-, 920-, and 950-MHz bands	Peak current consumption during packet reception at the sensitivity threshold		22		mA
	169-MHz band			23		
Average current consumption Check for data packet every 1 second using Wake on Radio		50 kbps, 5-byte preamble, 40-kHz RC oscillator used as sleep timer		15		μA
CURRENT CONSUMPTION, RECEIVE MODE (LOW-POWER MODE)⁽¹⁾						
RX peak current Low-power RX mode	1.2 kbps	Peak current consumption during packet reception at the sensitivity level		17		mA

(1) $T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$, $f_c = 869.5\text{ MHz}$ if nothing else stated.

(2) See the sniff mode design note for more information ([SWRA428](#)).

4.5 Receive Parameters

All RX measurements made at the antenna connector, to a bit error rate (BER) limit of 1%.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
GENERAL RECEIVE PARAMETERS (HIGH-PERFORMANCE MODE)⁽¹⁾						
Saturation				+10		dBm
Digital channel filter programmable bandwidth			8		200	kHz
IIP3, normal mode		At maximum gain		-14		dBm
IIP3, high linearity mode		Using 6-dB gain reduction in front end		-8		dBm
Data rate offset tolerance		With carrier sense detection enabled and assuming 4-byte preamble		±12%		
		With carrier sense detection disabled		±0.2%		
Spurious emissions	1–13 GHz (VCO leakage at 3.5 GHz)	Radiated emissions measured according to ETSI EN 300 220, $f_c = 869.5$ MHz		-56		dBm
	30 MHz to 1 GHz			< -57		
Optimum source impedance	868-, 915-, and 920-MHz bands	(Differential or single-ended RX configurations)		60 + j60 / 30 + j30		Ω
	433-MHz band			100 + j60 / 50 + j30		
	169-MHz band			140 + j40 / 70 + j20		
RX PERFORMANCE IN 950-MHZ BAND (HIGH-PERFORMANCE MODE)⁽²⁾						
Sensitivity ⁽³⁾		1.2 kbps, DEV = 4 kHz CHF = 10 kHz ⁽⁴⁾		-120		dBm
		1.2 kbps, DEV = 20 kHz CHF = 50 kHz ⁽⁴⁾		-114		
		50 kbps 2GFSK, DEV = 25 kHz, CHF = 100 kHz ⁽⁴⁾		-107		
		200 kbps, DEV = 83 kHz (outer symbols), CHF = 200 kHz ⁽⁴⁾ , 4GFSK ⁽⁵⁾		-100		
Blocking and Selectivity	1.2 kbps 2FSK, 12.5-kHz channel separation, 4-kHz deviation, 10-kHz channel filter	± 12.5 kHz (adjacent channel)		51		dB
		± 25 kHz (alternate channel)		52		
		± 1 MHz		73		
		± 2 MHz		76		
		± 10 MHz		81		
	1.2 kbps 2FSK, 50-kHz channel separation, 20-kHz deviation, 50-kHz channel filter	± 50 kHz (adjacent channel)		47		
		+ 100 kHz (alternate channel)		48		
		± 1 MHz		69		
		± 2 MHz		71		
		± 10 MHz		78		
	50 kbps 2GFSK, 200-kHz channel separation, 25-kHz deviation, 100-kHz channel filter (Same modulation format as 802.15.4g Mandatory Mode)	± 200 kHz (adjacent channel)		43		
		± 400 kHz (alternate channel)		51		
		± 1 MHz		62		
		± 2 MHz		65		
		± 10 MHz		71		
	200 kbps 4GFSK, 83-kHz deviation (outer symbols), 200-kHz channel filter, zero IF	± 200 kHz (adjacent channel)		37		
± 400 kHz (alternate channel)			44			
± 1 MHz			55			
± 2 MHz			58			
± 10 MHz			64			

(1) $T_A = 25^\circ\text{C}$, $V_{DD} = 3.0$ V, $f_c = 869.5$ MHz if nothing else stated.

(2) $T_A = 25^\circ\text{C}$, $V_{DD} = 3.0$ V if nothing else stated.

(3) Sensitivity can be improved if the TX and RX matching networks are separated.

(4) DEV is short for deviation, CHF is short for Channel Filter Bandwidth

(5) BT = 0.5 is used in all GFSK measurements

Receive Parameters *(continued)*

All RX measurements made at the antenna connector, to a bit error rate (BER) limit of 1%.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
RX PERFORMANCE IN 868-, 915-, AND 920-MHZ BANDS (HIGH-PERFORMANCE MODE)⁽²⁾						
Sensitivity		300 bps with coding gain (using a PN spreading sequence with 4 chips per data bit) DEV = 4 kHz CHF = 10 kHz ⁽⁴⁾		-127		dBm
		1.2 kbps, DEV = 4 kHz CHF = 10 kHz ⁽⁴⁾		-123		
		1.2 kbps, DEV = 10 kHz CHF = 42 kHz ⁽⁴⁾		-120		
		1.2 kbps, DEV = 20 kHz CHF = 50 kHz ⁽⁴⁾		-117		
		4.8 kbps OOK		-114		
		38.4 kbps, DEV = 20 kHz CHF = 100 kHz ⁽⁴⁾		-110		
		50 kbps 2GFSK, DEV = 25 kHz, CHF = 100 kHz ⁽⁴⁾		-110		
		200 kbps, DEV = 83 kHz (outer symbols), CHF = 200 kHz ⁽⁴⁾ , 4GFSK		-103		
Blocking and Selectivity	1.2-kbps 2-FSK, 12.5-kHz channel separation, 4-kHz deviation, 10-kHz channel filter	± 12.5 kHz (adjacent channel)		54		dB
		± 25 kHz (alternate channel)		54		
		± 1 MHz		75		
		± 2 MHz		79		
		± 10 MHz		87		
	1.2-kbps 2-FSK, 12.5-kHz channel separation, using settings optimized for blocking performance (3-kHz deviation, 7.8-kHz channel filter, minimum loop bandwidth)	± 1 kHz		78		
		± 2 kHz		82		
		± 8 MHz		88		
		± 10 MHz		88		
	1.2-kbps 2-FSK, 50-kHz channel separation, 20-kHz deviation, 50-kHz channel filter	± 50 kHz (adjacent channel)		48

4.9 32-MHz Crystal Oscillator

$T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$ if nothing else stated

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Crystal frequency	It is expected that there be will degraded sensitivity at multiples of XOSC/2 in RX, and an increase in spurious emissions when the RF channel is close to multiples of XOSC in TX. We recommend that the RF channel is kept RX_BW/2 away from XOSC/2 in RX, and that the level of spurious emissions be evaluated if the RF channel is closer than 1 MHz to multiples of XOSC in TX.	31.25	32	33.6	MHz
Load capacitance (C_L)			10		pF
ESR	Simulated over operating conditions			60	Ω

4.10 32-kHz Clock Input

$T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$ if nothing else stated

PARAMETER	MIN	TYP	MAX	UNIT
Clock frequency		32		kHz
32-kHz clock input pin input high voltage	$0.8 \times V_{DD}$			V
32-kHz clock input pin input high voltage		$0.2 \times V_{DD}$		V

4.11 32-kHz RC Oscillator

 $T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$ if nothing else stated

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Frequency	After calibration		32		kHz
Frequency accuracy after calibration	Relative to frequency reference (32-MHz crystal or TCXO)		$\pm 0.1\%$		
Initial calibration time ⁽¹⁾					

(1) For Initial calibration time of the 32-kHz RC Oscillator, see [Section 4.15](#).

4.12 I/O and Reset

 $T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$ if nothing else stated

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Logic input high voltage		$0.8 \times V_{DD}$			V
Logic input low voltage				$0.2 \times V_{DD}$	V
Logic output high voltage	At 4-mA output load or less	$0.8 \times V_{DD}$			V
Logic output low voltage				$0.2 \times V_{DD}$	V
Power-on reset threshold	Voltage on DVDD pin		1.3		V

4.13 Temperature Sensor

 $T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$ if nothing else stated⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Temperature sensor range		-40		85	$^\circ\text{C}$
Temperature coefficient	Change in sensor output voltage versus change in temperature		2.66		mV/ $^\circ\text{C}$
Typical output voltage	Typical sensor output voltage at $T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$		794		mV
VDD coefficient	Change in sensor output voltage versus change in VDD		1.17		mV/V

(1) The CC1120 device can be configured to provide a voltage proportional to temperature on GPIO1. The temperature can be estimated by measuring this voltage (see [Section 4.13, Temperature Sensor](#)). For more information, refer to *CC112X/CC120X On-Chip Temperature Sensor* ([SWRA415](#)).

4.14 Thermal Resistance Characteristics for RHB Package

NAME	DESCRIPTION	$^\circ\text{C/W}^{(1)}$
$R\theta_{JC(\text{top})}$	Junction-to-case (top)	21.1
$R\theta_{JB}$	Junction-to-board	5.3
$R\theta_{JA}$	Junction-to-free air	31.3
Ψ_{siJT}	Junction-to-package top	0.2
Ψ_{siJB}	Junction-to-board	5.3
$R\theta_{JC(\text{bot})}$	Junction-to-case (bottom)	0.8

(1) These values are based on a JEDEC-defined 2S2P system (with the exception of the Theta JC [$R\theta_{JC}$] value, which is based on a JEDEC-defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Package Thermal Measurements*

Power dissipation of 40 mW and an ambient temperature of 25°C is assumed.

4.15 Timing Requirements

$T_A = 25^\circ\text{C}$, $V_{DD} = 3.0\text{ V}$, $f_c = 869.5\text{ MHz}$ if nothing else stated

PARAMETER	TEST CONDITIONS	MIN	NOM	MAX	UNIT
Power down to IDLE	Depends on crystal		0.4		ms
IDLE to RX/TX	Calibration disabled		166		μs
	Calibration enabled		461		
RX/TX turnaround			50		μs
RX/TX to IDLE time	Calibrate when leaving RX/TX enabled		296		μs
	Calibrate when leaving RX/TX disabled		0

5 Detailed Description

5.1 Block Diagram

Figure 5-1 shows the system block diagram of the CC1120 devices.

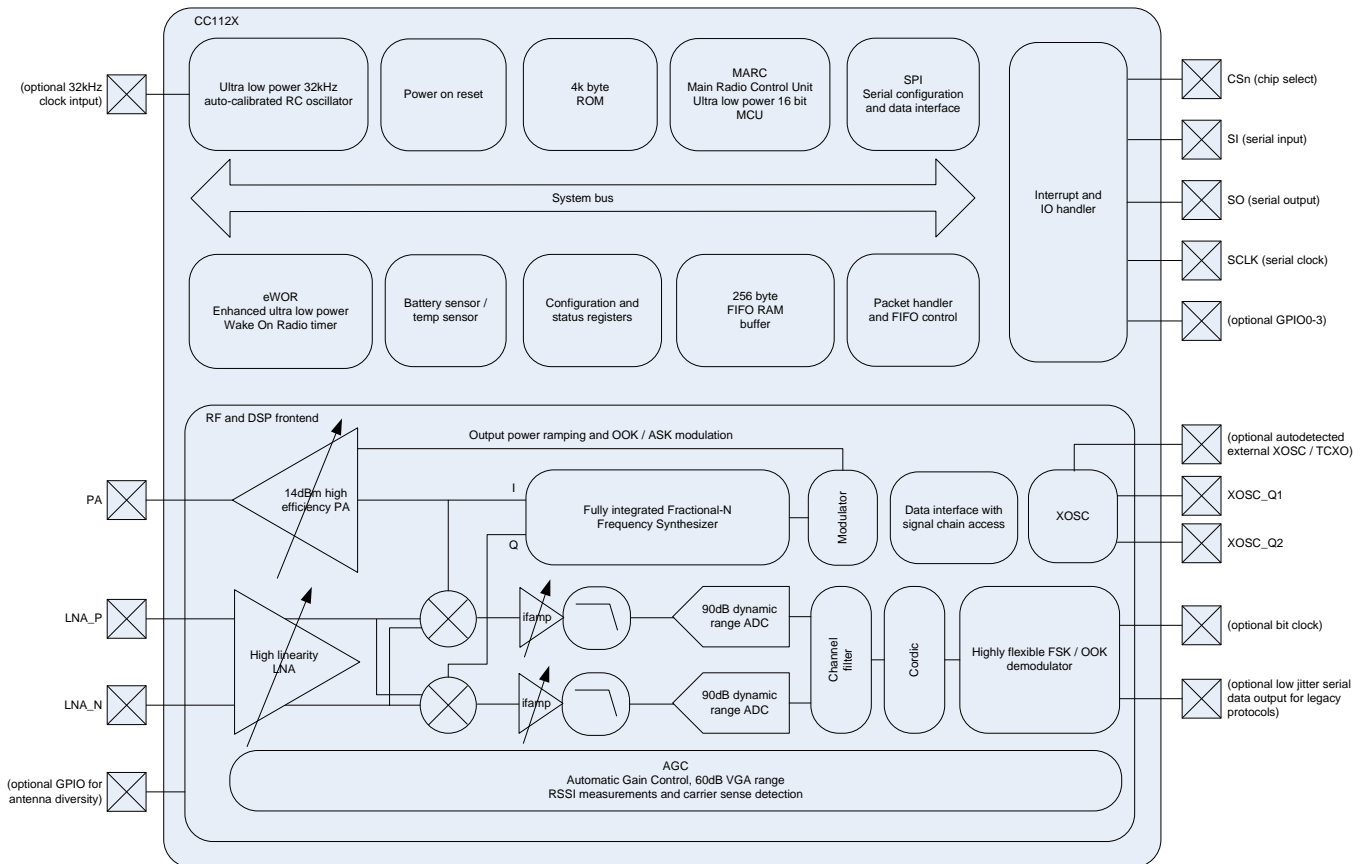

Figure 5-1. System Block Diagram

5.2 Frequency Synthesizer

At the center of the CC1120 device there is a fully integrated, fractional-N, ultra-high-performance frequency synthesizer. The frequency synthesizer is designed for excellent phase noise performance, providing very high selectivity and blocking performance. The system is designed to comply with the most stringent regulatory spectral masks at maximum transmit power.

Either a crystal can be connected to XOSC_Q1 and XOSC_Q2, or a TCXO can be connected to the EXT_XOSC input. The oscillator generates the reference frequency for the synthesizer, as well as clocks for the analog-to-digital converter (ADC) and the digital part. To reduce system cost, CC1120 device has high-accuracy frequency estimation and compensation registers to measure and compensate for crystal inaccuracies. This compensation enables the use of lower cost crystals. If a TCXO is used, the CC1120 device automatically turns on and off the TCXO when needed to support low-power modes and Wake-On-Radio operation.

5.3 Receiver

The CC1120 device features a highly flexible receiver. The received RF signal is amplified by the low-noise amplifier (LNA) and is down-converted in quadrature (I/Q) to the intermediate frequency (IF). At IF, the I/Q signals are digitized by the high dynamic-range ADCs.

An advanced automatic gain control (AGC) unit adjusts the front-end gain, and enables the CC1120 device to receive strong and weak signals, even in the presence of strong interferers. High-attenuation channels and data filtering enable reception with strong neighbor channel interferers. The I/Q signal is converted to a phase and magnitude signal to support the FSK and OOK modulation schemes.

NOTE

A unique I/Q compensation algorithm removes any problem of I/Q mismatch, thus avoiding time-consuming and costly I/Q image calibration steps.

The CC1120 device only requires preamble to settle the AGC. The minimum number of preamble required is 0.5 byte.

5.4 Transmitter

The CC1120 transmitter is based on direct synthesis of the RF frequency (in-loop modulation). To use the spectrum effectively, the CC1120 device has extensive data filtering and shaping in TX mode to support high throughput data communication in narrowband channels. The modulator also controls power ramping to remove issues such as spectral splattering when driving external high-power RF amplifiers.

5.5 Radio Control and User Interface

The CC1120 digital control system is built around the main radio control (MARC), which is implemented using an internal high-performance, 16-bit ultra-low-power processor. MARC handles power modes, radio sequencing, and protocol timing.

A 4-wire SPI serial interface is used for configuration and data buffer access. The digital baseband includes support for channel configuration, packet handling, and data buffering. The host MCU can stay in power-down mode until a valid RF packet is received. This greatly reduces power consumption. When the host MCU receives a valid RF packet, it burst-reads the data. This reduces the required computing power.

The CC1120 radio control and user interface are based on the widely used CC1101 transceiver. This relationship enables an easy transition between the two platforms. The command strobes and the main radio states are the same for the two platforms.

For legacy formats, the CC1120 device also supports two serial modes.

- Synchronous serial mode: The CC1120 device performs bit synchronization and provides the MCU with a bit clock with associated data.
- Transparent mode: The CC1120 device outputs the digital baseband signal using a digital interpolation filter to eliminate jitter introduced by digital filtering and demodulation.

5.6 Enhanced Wake-On-Radio (eWOR)

eWOR, using a flexible integrated sleep timer, enables automatic receiver polling with no intervention from the MCU. When the CC1120 device enters RX mode, it listens and then returns to sleep if a valid RF packet is not received. The sleep interval and duty cycle can be configured to make a trade-off between network latency and power consumption. Incoming messages are time-stamped to simplify timer re-synchronization.

The eWOR timer runs off an ultra-low-power 32-kHz RC oscillator. To improve timing accuracy, the RC oscillator can be automatically calibrated to the RF crystal in configurable intervals.

5.7 Sniff Mode

The CC1120 device supports quick start up times, and requires few preamble bits. Sniff mode uses these conditions to dramatically reduce the current consumption while the receiver is waiting for data.

Because the CC1120 device can wake up and settle much faster than the duration of most preambles, it is not required to be in RX mode continuously while waiting for a packet to arrive. Instead, the enhanced Wake-On-Radio feature can be used to put the device into sleep mode periodically. By setting an appropriate sleep time, the CC1120 device can wake up and receive the packet when it arrives with no performance loss. This sequence removes the need for accurate timing synchronization between transmitter and receiver, and lets the user trade off current consumption between the transmitter and receiver.

For more information, see the sniff mode design note ([SWRA428](#)).

5.8 Antenna Diversity

Antenna diversity can increase performance in a multipath environment. An external antenna switch is required. The CC1201 device uses one of the GPIO pins to automatically control the switch. This device also supports differential output control signals typically used in RF switches.

If antenna diversity is enabled, the GPIO alternates between high and low states until a valid RF input signal is detected. An optional acknowledge packet can be transmitted without changing the state of the GPIO.

An incoming RF signal can be validated by received signal strength or by using the automatic preamble detector. Using the automatic preamble detector ensures a more robust system and avoids the need to set a defined signal strength threshold (such a threshold sets the sensitivity limit of the system).

5.9 WaveMatch

Advanced capture logic locks onto the synchronization word and does not require preamble settling bytes. Therefore, receiver settling time is reduced to the settling time of the AGC, typically 4 bits.

The WaveMatch feature also greatly reduces false sync triggering on noise, further reducing the power consumption and improving sensitivity and reliability. The same logic can also be used as a high-performance preamble detector to reliably detect a valid preamble in the channel.

See [SWRC046](#) for more information.

6 Application, Implementation, and Layout

NOTE

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

6.1 Application Information

6.1.1 Typical Application Circuit

NOTE

This section is intended only as an introduction. The reference designs listed in [Section 6.1.2](#) show everything required.

Very few external components are required for the operation of the CC1120 device. [Figure 6-1](#) shows a typical application circuit. The board layout will greatly influence the RF performance of the CC1120 device. [Figure 6-1](#) does not show decoupling capacitors for power pins.

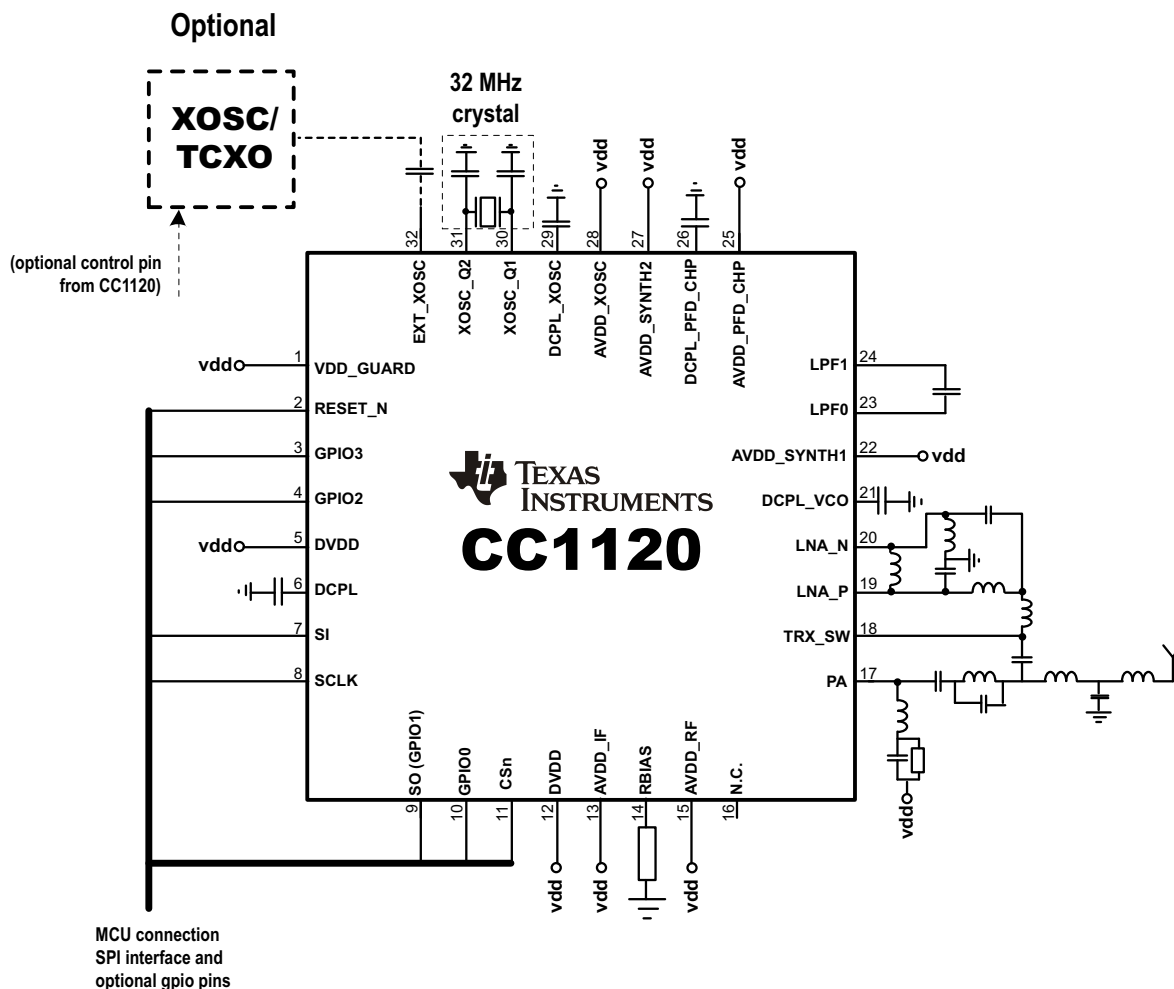

Figure 6-1. Typical Application Circuit

6.1.2 TI Reference Designs

The following reference designs are available for the CC1120 device:

[CC1120EM-868-915-RD](#) *CC1120EM 868- to 915-MHz Reference Design*

This RF Layout Reference Design demonstrates good decoupling and layout techniques for a low power RF device operating in the 868-MHz and 915-MHz frequency bands.

[CC1120EM-420-470-RD](#) *CC1120EM 420- to 470-MHz Reference Design*

This RF Layout Reference Design demonstrates good decoupling and layout techniques for a low power RF device operating in the 420-470 MHz frequency band. ([SWRC221](#))

7 Device and Documentation Support

7.1 Device Support

7.1.1 Development Support

7.1.1.1 Configuration Software

The CC1120 device can be configured using the SmartRF Studio software ([SWRC046](#)). The SmartRF Studio software is highly recommended for obtaining optimum register settings, and for evaluating performance and functionality.

7.1.2 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, CC1120). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, RHB) and the temperature range (for example, blank is the default commercial temperature range) provides a legend for reading the complete device name for any CC1120 device.

For orderable part numbers of CC1120 devices in the QFN package types, see the Package Option Addendum of this document, the TI website (www.ti.com), or contact your TI sales representative.

7.2 Documentation Support

7.2.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

[TI E2E™ Online Community](#) *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

[Design Support](#) *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

7.3 Trademarks

SmartRF, E2E are trademarks of Texas Instruments.

7.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

8 Mechanical Packaging and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
