

## LM5102 High-Voltage Half-Bridge Gate Driver With Programmable Delay

### 1 Features

- Drives Both a High-Side and Low-Side N-Channel MOSFET
- Independently Programmable High and Low Side Rising Edge Delay
- Bootstrap Supply Voltage Range up to 118 V dc
- Fast Turn-Off Propagation Delay (25 ns Typical)
- Drives 1000-pF Loads with 15-ns Rise and Fall Times
- Supply Rail Undervoltage Lockout
- Low Power Consumption
- Timer Can Be Terminated Midway Through Sequence

### 2 Applications

- Current Fed Push-Pull Power Converters
- Half and Full Bridge Power Converters
- Synchronous Buck Converters
- Two Switch Forward Power Converters
- Forward with Active Clamp Converters

### 3 Description

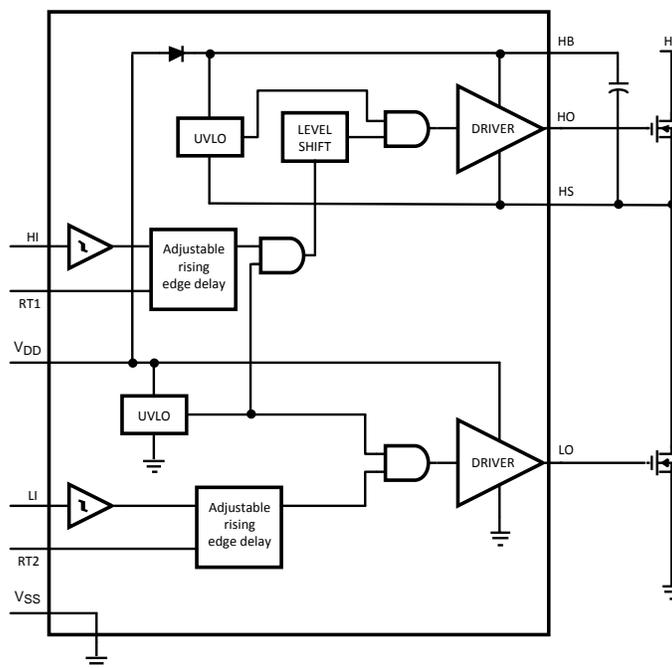

The LM5102 high-voltage gate driver is designed to drive both the high side and the low side N-Channel MOSFETs in a synchronous buck or a half bridge configuration. The floating high-side driver is capable of working with supply voltages up to 100 V. The outputs are independently controlled. The rising edge of each output can be independently delayed with a programming resistor. An integrated high voltage diode is provided to charge the high side gate drive bootstrap capacitor. A robust level shifter operates at high speed while consuming low power and providing clean level transitions from control logic to the high side gate driver. Undervoltage lockout is provided on both the low side and the high side power rails. This device is available in the standard VSSOP 10 pin and the WSON 10 pin packages.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LM5102	VSSOP (10)	3.00 mm x 3.00 mm
	WSON (10)	4.00 mm x 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

10 Pin  
VSSOP (DGS), WSON (DPR)  
Top View

Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION	APPLICATION INFORMATION
NAME	WSON <sup>(2)</sup> , VSSOP			
HB	2	P	High-side gate driver bootstrap rail	Connect the positive terminal of bootstrap capacitor to the HB pin and connect negative terminal of bootstrap capacitor to HS. The Bootstrap capacitor should be placed as close to IC as possible.
HI	7	I	High-side driver control input	TTL compatible thresholds. Unused inputs should be tied to ground and not left open.
HO	3	O	High-side gate driver output	Connect to gate of high-side MOSFET with short low-inductance path.
HS	4	P	High-side MOSFET source connection	Connect bootstrap capacitor negative terminal and source of high side MOSFET.
LI	8	I	Low-side driver control input	TTL compatible thresholds. Unused inputs should be tied to ground and not left open.
LO	10	O	Low-side gate driver output	Connect to the gate of the low side MOSFET with a short low inductance path.
RT1	5	A	High-side output edge delay programming	Resistor from RT1 to ground programs the leading edge delay of the high side gate driver. The resistor should be placed close to the IC to minimize noise coupling from adjacent traces.
RT2	6	A	Low-side output edge delay programming	Resistor from RT2 to ground programs the leading edge delay of the low side gate driver. The resistor should be placed close to the IC to minimize noise coupling from adjacent traces.
V <sub>DD</sub>	1	P	Positive gate drive supply	Locally decouple to VSS using low ESR/ESL capacitor, located as close to IC as possible.
V <sub>SS</sub>	9	G	Ground return	All signals are referenced to this ground.

(1) P = Power, G = Ground, I = Input, O = Output, A = Analog

(2) For the WSON package, it is recommended that the exposed pad on the bottom of the LM5100 and LM5101 be soldered to ground plane on the PC board, and the ground plane should extend out from beneath the IC to help dissipate the heat.

## 6 Specifications

### 6.1 Absolute Maximum Ratings<sup>(1)(2)</sup>

	MIN	MAX	UNIT
$V_{DD}$ to $V_{SS}$	-0.3	18	V
$V_{HB}$ to $V_{HS}$	-0.3	18	V
LI or HI Inputs to $V_{SS}$	-0.3	$V_{DD} + 0.3$	V
LO Output	-0.3	$V_{DD} + 0.3$	V
HO Output	$V_{HS} - 0.3$	$V_{HB} + 0.3$	V
$V_{HS}$ to $V_{SS}$	-1	100	V
$V_{HB}$ to $V_{SS}$		118	V
RT1 and RT2 to $V_{SS}$	-0.3	5	V
Junction Temperature		150	°C
Storage Temperature Range	-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.

### 6.2 ESD Ratings

	VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

	MIN	MAX	UNIT
$V_{DD}$	9	14	V
HS	-1	100	V
HB	$V_{HS} + 8$	$V_{HS} + 14$	V
HS Slew Rate		< 50	V/ns
Junction Temperature	-40	125	°C

## 7 Detailed Description

### 7.1 Overview

The LM5102 device offers a unique flexibility with independently programmable delay of the rising edge for both high and low side driver outputs independently. The delays are set with resistors at the RT1 and RT2 pins, and can be adjusted from 100 ns to 600 ns. This feature reduces component count, board space and cost compared to discrete solutions for adjusting driver dead time. The wide delay programming range provides the flexibility to optimize drive signal timing for a wide range of MOSFETs and applications.

The RT pins are biased at 3 V and current limited to 1 mA maximum programming current. The time delay generator will accommodate resistor values from 5 k to 100 k with turn-on delay times that are proportional to the RT resistance. In addition, each RT pin is monitored by a comparator that will bypass the turn-on delay if the RT pin is pulled below the timer elimination threshold (1.8 V typical). Grounding the RT pins programs the LM5102 to drive both outputs with minimum turn-on delay.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Startup and UVLO

Both top and bottom drivers include undervoltage lockout (UVLO) protection circuitry which monitors the supply voltage ( $V_{DD}$ ) and bootstrap capacitor voltage ( $V_{HB} - V_{HS}$ ) independently. The UVLO circuit inhibits each driver until sufficient supply voltage is available to turn-on the external MOSFETs, and the built-in hysteresis prevents chattering during supply voltage transitions. When the supply voltage is applied to  $V_{DD}$  pin of LM5102, the top and bottom gates are held low until  $V_{DD}$  exceeds UVLO threshold, typically about 6.9 V. Any UVLO condition on the bootstrap capacitor will disable only the high side output (HO).

### 7.4 Device Functional Modes

LI Pin	LO Pin	HI Pin	HO Pin
L	L	L	L
H	H	H	H

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LM5102 is one of the latest generation of high voltage gate drivers which are designed to drive both the high-side and low-side N-Channel MOSFETs in a half-bridge/full bridge configuration or in a synchronous buck circuit. The floating high side driver is capable of operating with supply voltages up to 100 V. This allows for N-Channel MOSFET control in half-bridge, full-bridge, push-pull, two switch forward and active clamp topologies.

In the LM5102 the outputs are independently controlled. The rising edge of each output can be independently delayed with a programming resistor.

Table 1. LM5102 Highlights

FEATURE	BENEFIT
Independently programmable high and low side delay	Allows optimisation of gate drive timings to account for device differences between high-side and low-side positions
Low power consumption	Improves light load efficiency figures
Internal bootstrap diode	Reduces parts count and PCB real estate

### 8.2 Typical Application

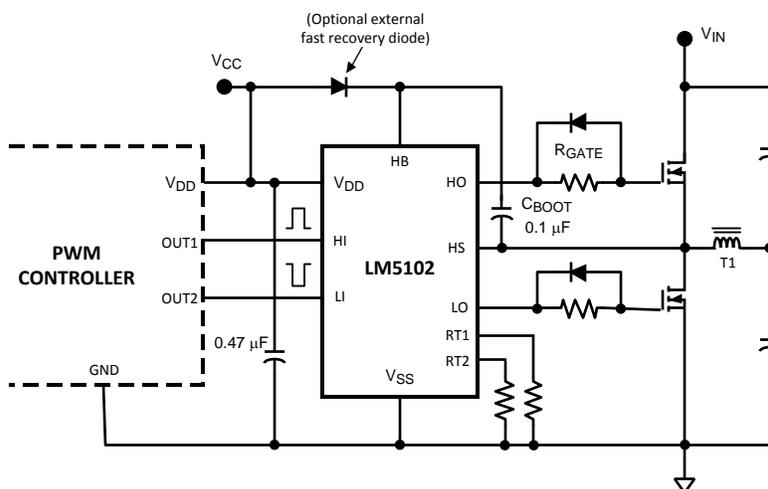

Figure 16. LM5102 Driving MOSFETs Connected in Half-Bridge Configuration

## Typical Application (continued)

### 8.2.1 Design Requirements

PARAMETERS	VALUES
Gate Drive IC	LM5102
Mosfet	CSD18531Q5A
$V_{DD}$	10 V
$Q_{gmax}$	43 nC
$F_{sw}$	100 kHz
$D_{Max}$	95%
$I_{HBO}$	10 $\mu$ A
$V_{DH}$	1.1 V
$V_{HBR}$	7.1 V
$V_{HBH}$	0.4 V

### 8.2.2 Detailed Design Procedure

$$\Delta V_{HB} = V_{DD} - V_{DH} - V_{HBL}$$

where

- $V_{DD}$  = Supply voltage of the gate drive IC
- $V_{DH}$  = Bootstrap diode forward voltage drop
- $V_{gsmin}$  = Minimum gate source threshold voltage

$$C_{BOOT} = \frac{Q_{TOTAL}}{\Delta V_{HB}} \quad (1)$$

$$Q_{TOTAL} = Q_{gmax} + I_{HBO} \times \frac{D_{Max}}{F_{SW}} \quad (2)$$

The quiescent current of the bootstrap circuit is 10  $\mu$ A which is negligible compared to the Qgs of the mosfet.

$$Q_{TOTAL} = 43nC + 10\mu A \times \frac{0.95}{100kHz} \quad (3)$$

$$Q_{TOTAL} = 43.01 \text{ nC} \quad (4)$$

In practice the value for the  $C_{BOOT}$  capacitor should be greater than that calculated to allow for situations where the power stage may skip pulse due to load transients. In this circumstance the boot capacitor must maintain the HB Pin voltage above the UVLO Voltage for the HB circuit.

As a general rule the local  $V_{DD}$  bypass capacitor should be 10 times greater than the value of  $C_{BOOT}$ .

$$V_{HBL} = V_{HBR} - V_{HBH} \quad (5)$$

$$V_{HBL} = 6.7 \text{ V} \quad (6)$$

$$\Delta V_{HB} = 10 \text{ V} - 1.1 \text{ V} - 6.7 \text{ V} \quad (7)$$

$$\Delta V_{HB} = 2.2 \text{ V} \quad (8)$$

$$C_{BOOT} = \frac{43.01nC}{2.2V} \quad (9)$$

$$C_{BOOT} = 19.54 \text{ nF} \quad (10)$$

The bootstrap and bias capacitors should be ceramic types with X7R dielectric. The voltage rating should be twice that of the maximum VDD to allow for loss of capacitance once the devices have a dc bias voltage across them and to ensure long term reliability of the devices.

The resistor values, RT1 and RT2, for setting turn on delay can be found in [Figure 18](#).

### 8.2.3 Application Curves

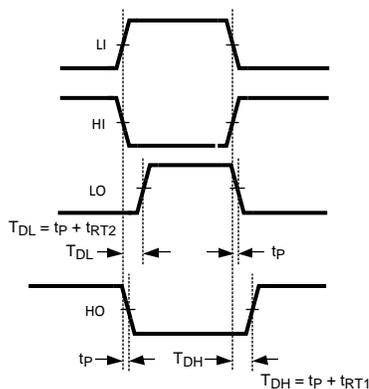

Figure 17. Application Timing Waveforms

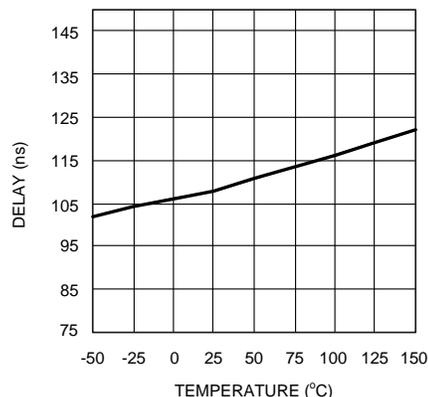

Figure 18. Turn On Delay vs Temperature (RT = 10 k)

## 9 Power Supply Recommendations

### 9.1 Power Dissipation Considerations

The total IC power dissipation is the sum of the gate driver losses and the bootstrap diode losses. The gate driver losses are related to the switching frequency ( $f$ ), output load capacitance on LO and HO ( $C_L$ ), and supply voltage ( $V_{DD}$ ) and can be roughly calculated as shown in Equation 12.

$$P_{DGATES} = 2 \times f \times C_L \times V_{DD}^2 \quad (12)$$

There are some additional losses in the gate drivers due to the internal CMOS stages used to buffer the LO and HO outputs. The following plot shows the measured gate driver power dissipation versus frequency and load capacitance. At higher frequencies and load capacitance values, the power dissipation is dominated by the power losses driving the output loads and agrees well with the above equation. This plot can be used to approximate the power losses due to the gate drivers.

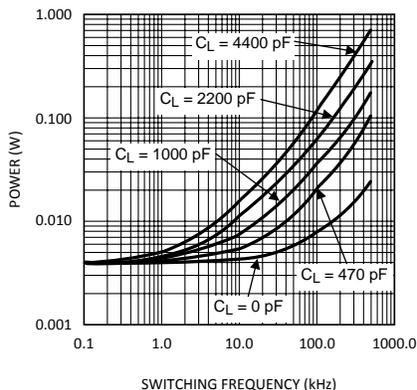

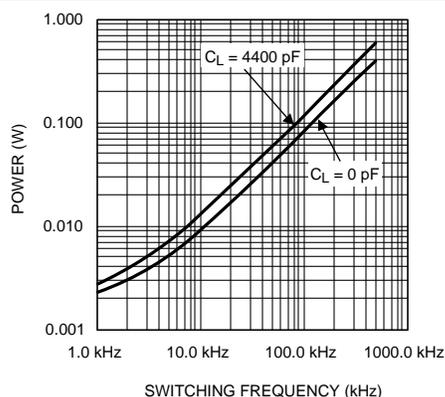

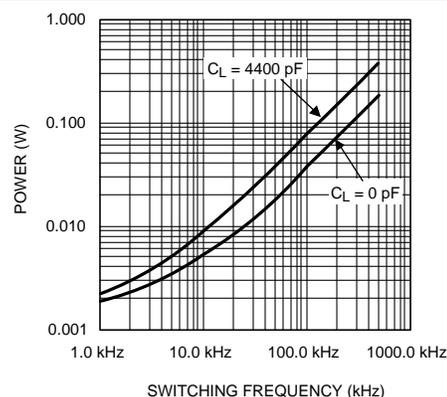

Figure 19. Gate Driver Power Dissipation (LO + HO)  
 $V_{CC} = 12 \text{ V}$ , Neglecting Diode Losses

The bootstrap diode power loss is the sum of the forward bias power loss that occurs while charging the bootstrap capacitor and the reverse bias power loss that occurs during reverse recovery. Because each of these events happens once per cycle, the diode power loss is proportional to frequency. Larger capacitive loads require more current to recharge the bootstrap capacitor resulting in more losses. Higher input voltages ( $V_{IN}$ ) to the half bridge result in higher reverse recovery losses. Figure 20 was generated based on calculations and lab measurements of the diode recovery time and current under several operating conditions. This can be useful for approximating the diode power dissipation.

## Power Dissipation Considerations (continued)

**Figure 20. Diode Power Dissipation  $V_{IN} = 80\text{ V}$**

**Figure 21. Diode Power Dissipation  $V_{IN} = 40\text{ V}$**

The total IC power dissipation can be estimated from the above plots by summing the gate drive losses with the bootstrap diode losses for the intended application. Because the diode losses can be significant, an external diode placed in parallel with the internal bootstrap diode (refer to [Figure 16](#)) and can be helpful in removing power from the IC. For this to be effective, the external diode must be placed close to the IC to minimize series inductance and have a significantly lower forward voltage drop than the internal diode.

## 10 Layout

### 10.1 Layout Guidelines

The optimum performance of high and low side gate drivers cannot be achieved without taking due considerations during circuit board layout. Following points are emphasized.

1. A low ESR/ESL capacitor must be connected close to the IC, and between  $V_{DD}$  and  $V_{SS}$  pins and between HB and HS pins to support high peak currents being drawn from  $V_{DD}$  during turn-on of the external MOSFET.
2. To prevent large voltage transients at the drain of the top MOSFET, a low ESR electrolytic capacitor must be connected between MOSFET drain and ground ( $V_{SS}$ ).
3. In order to avoid large negative transients on the switch node (HS) pin, the parasitic inductances in the source of top MOSFET and in the drain of the bottom MOSFET (synchronous rectifier) must be minimized.
4. Grounding considerations:
  - The first priority in designing grounding connections is to confine the high peak currents from charging and discharging the MOSFET gate in a minimal physical area. This will decrease the loop inductance and minimize noise issues on the gate terminal of the MOSFET. The MOSFETs should be placed as close as possible to the gate driver.
  - The second high current path includes the bootstrap capacitor, the bootstrap diode, the local ground referenced bypass capacitor and low side MOSFET body diode. The bootstrap capacitor is recharged on the cycle-by-cycle basis through the bootstrap diode from the ground referenced  $V_{DD}$  bypass capacitor. The recharging occurs in a short time interval and involves high peak current. Minimizing this loop length and area on the circuit board is important to ensure reliable operation.
5. The resistors on the RT1 and RT2 timer pins must be placed very close to the IC and separated from high current paths to avoid noise coupling to the time delay generator which could disrupt timer operation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM5102MM/NOPB	ACTIVE	VSSOP	DGS	10	1000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 125	5102	<a href="#">Samples</a>
LM5102MMX/NOPB	ACTIVE	VSSOP	DGS	10	3500	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 125	5102	<a href="#">Samples</a>
LM5102SD/NOPB	ACTIVE	WSOP	DPR	10	1000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 125	5102SD	<a href="#">Samples</a>
LM5102SDX/NOPB	ACTIVE	WSOP	DPR	10	4500	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 125	5102SD	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

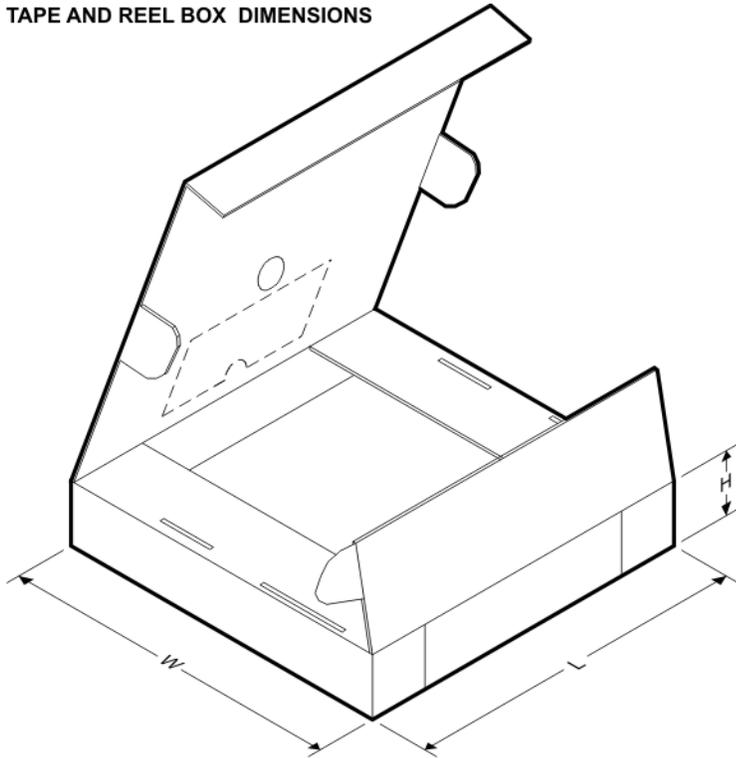

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
