

SNAS438A - NOVEMBER 2008 - REVISED APRIL 2013

# LME49724 High Performance, High Fidelity, Fully-Differential Audio Operational Amplifier

Check for Samples: LME49724

# FEATURES

- Drives 600Ω Loads with Full Output Signal Swing
- Optimized for Superior Audio Signal Fidelity
- Output Short Circuit Protection
- PSRR and CMRR Exceed 100dB (typ)
- Available in SO PowerPad Package

# APPLICATIONS

- Ultra High Quality Audio Amplification
- High Fidelity Preamplifiers and Active Filters
- Simple Single-Ended to Differential Conversion
- State of the Art D-to-A Converters
- State of the Art A-to-D input Amplifiers
- Professional Audio
- High Fidelity Equalization and Crossover Networks
- High Performance Line Drivers and Receivers

# DESCRIPTION

The LME49724 is an ultra-low distortion, low noise, high slew rate fully-differential operational amplifier optimized and fully specified for high performance, high fidelity applications. Combining advanced leading-edge process technology with state of the art circuit design, the LME49724 fully-differential audio operational amplifier delivers superior audio signal amplification for outstanding audio performance. The LME49724 combines extremely low voltage noise density (2.1nV/vHz) with vanishingly low THD+N (0.00003%) to easily satisfy the most demanding audio applications. To ensure that the most challenging loads are driven without compromise, the LME49724 has a high slew rate of ±18V/µs and an output current capability of ±80mA. Further, dynamic range is maximized by an output stage that drives 600 $\Omega$  loads to 52V<sub>P-P</sub> while operating on a ±15V supply voltage.

The LME49724's outstanding CMRR (102dB), PSRR (125dB), and  $V_{OS}$  (0.2mV) results in excellent operational amplifier DC performance.

The LME49724 has a wide supply range of  $\pm 2.5V$  to  $\pm 18V$ . Over this supply range the LME49724's input circuitry maintains excellent common-mode and power supply rejection, as well as maintaining its low input bias current. The LME49724 is unity gain stable. This Fully-Differential Audio Operational Amplifier achieves outstanding AC performance while driving complex loads with capacitive values as high as 100pF.

### Table 1. Key Specifications

| Power Supply Voltage Range   |                   | ±2.5V to ±18V   |
|--|-------------------|-----------------|
| THD+N (A <sub>V</sub> = 1, V <sub>OUT</sub> = $3V_{RMS}$ , f <sub>IN</sub> = 1kHz) | $R_L = 2k\Omega$  | 0.00003% (typ)  |
|  | $R_L = 600\Omega$ | 0.00003% (typ)  |
| Input Noise Density  |                   | 2.1nV/√Hz (typ) |
| Slew Rate  |                   | ±18V/µs (typ)   |
| Gain Bandwidth Product   |                   | 50 MHz (typ)    |
| Open Loop Gain ( $R_L = 600\Omega$ )   |                   | 125 dB (typ)    |
| Input Bias Current   |                   | 60nA (typ)      |
| Input Offset Voltage   |                   | 0.2mV (typ)     |
| DC Gain Linearity Error  |                   | 0.00009%        |

JMENTS

#### SNAS438A - NOVEMBER 2008 - REVISED APRIL 2013

| Pin        | Name              | Pin Function   | Туре          |
|------------|-------------------|--|---------------|
| 1          | V <sub>IN-</sub>  | Input pin  | Analog Input  |
| 2          | V <sub>OCM</sub>  | Sets the output DC voltage. Internally set by a resistor divider to the midpoint of the voltages on the V <sub>CC</sub> and V <sub>EE</sub> pins. Can be forced externally to a different voltage ( $50k\Omega$ input impedance).                              | Analog Input  |
| 3          | V <sub>CC</sub>   | Positive power supply pin.   | Power Supply  |
| 4          | V <sub>OUT+</sub> | Output pin. Signal is inverted relative to $V_{IN}$ where the feedback loop is connected.  | Analog Output |
| 5          | V <sub>OUT-</sub> | Output pin. Signal is inverted relative to $V_{IN+}$ where the feedback loop is connected.   | Analog Output |
| 6          | V <sub>EE</sub>   | Negative power supply pin or ground for a single supply configuration.   | Power Supply  |
| 7          | ENABLE            | Enables the LME49724 when the voltage is greater than 2.35V above the voltage on the V <sub>EE</sub> pin. Disable the LME49724 by connecting to the same voltage as on the V <sub>EE</sub> pin which will reduce current consumption to less than 0.3mA (typ). | Analog Input  |
| 8          | V <sub>IN+</sub>  | Input pin  | Analog Input  |
| xposed Pad |                   | Exposed pad for improved thermal performance. Connect to the same potential as the $V_{\text{EE}}$ pin or electrically isolate.  |               |

PIN DESCRIPTIONS

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### Absolute Maximum Ratings (1)(2)(3)

| Power Supply Voltage                      | $(V_{S} = V_{CC} +  V_{EE} )$ | 38V                                    |  |
|---|-------------------------------|--|--|
| Storage Temperature                       |                               | −65°C to 150°C                         |  |
| Input Voltage                             |                               | $(V_{EE}) - 0.7V$ to $(V_{CC}) + 0.7V$ |  |
| Output Short Circuit                      | Continuous                    |  |  |
| Power Dissipation <sup>(4)</sup>          |                               | Internally Limited                     |  |
| ESD Rating <sup>(5)</sup>                 | SD Rating <sup>(5)</sup>      |  |  |
| ESD Rating <sup>(6)</sup>                 |                               | 200V                                   |  |
| Junction Temperature (T <sub>JMAX</sub> ) |                               | 150°C                                  |  |
| Soldering Information                     | Vapor Phase (60sec.)          | 215°C                                  |  |
|   | Infrared (60sec.)             | 220°C                                  |  |
| Thermal Resistance                        | θ <sub>JA</sub> (MR)          | 49.6°C/W                               |  |

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified.

(2) The Electrical Characteristics tables list specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not ensured.

(3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.

(4) The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{JMAX}$ ,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation is  $P_{DMAX} = (T_{JMAX} - T_A) / \theta_{JA}$  or the number given in *Absolute Maximum Ratings*, whichever is lower.

(5) Human body model, applicable std. JESD22-A114C.

(6) Machine model, applicable std. JESD22-A115-A.

|                   |                                   | $-10V < V_{OUT} < 10V, R_{L} = 10k\Omega$                                    | 125                    |                      | dB                   |  |

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified.

(2) The Electrical Characteristics tables list specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not ensured.

(3) Typical values represent most likely parametric norms at T<sub>A</sub> = +25°C, and at the *Recommended Operation Conditions* at the time of product characterization and are not ensured.

(4) Datasheet min/max specification limits are specified by test or statistical analysis.

(5) PSRR is measured as follows:  $V_{OS}$  is measured at two supply voltages, ±5V and ±15V. PSRR = |  $20\log(\Delta V_{OS}/\Delta V_S)$  |.

(6) The ENABLE threshold voltage is determined by V<sub>BE</sub> voltages and will therefore vary with temperature. The typical values represent the most likely parametric norms at T<sub>A</sub> = +25°C.

# APPLICATION INFORMATION

### **GENERAL OPERATION**

The LME49724 is a fully differential amplifier with an integrated common-mode reference input (V<sub>OCM</sub>). Fully differential amplification provides increased noise immunity, high dynamic range, and reduced harmonic distortion products.

Differential amplifiers typically have high CMRR providing improved immunity from noise. When input, output, and supply line trace pairs are routed together, noise pick up is common and easily rejected by the LME49724. CMRR performance is directly proportional to the tolerance and matching of the gain configuring resistors. With 0.1% tolerance resistors the worst case CMRR performance will be about 60dB (20LOG(0.001)).

A differential output has a higher dynamic range than a single-ended output because of the doubling of output voltage. The dynamic range is increased by 6dB as a result of the outputs being equal in magnitude but opposite in phase. As an example, a single-ended output with a  $1V_{PP}$  signal will be two  $1V_{PP}$  signals with a differential output. The increase is 20LOG(2) = 6dB. Differential amplifiers are ideal for low voltage applications because of the increase in signal amplitude relative to a single-ended amplifier and the resulting improvement in SNR.

Differential amplifiers can also have reduced even order harmonics, all conditions equal, when compared to a single-ended amplifier. The differential output causes even harmonics to cancel between the two inverted outputs leaving only the odd harmonics. In practice even harmonics do not cancel completely, however there still is a reduction in total harmonic distortion.

# OUTPUT COMMON-MODE VOLTAGE (V<sub>OCM</sub> pin)

The output common-mode voltage is the DC voltage on each output. The output common-mode voltage is set by the V<sub>OCM</sub> pin. The V<sub>OCM</sub> pin can be driven by a low impedance source. If no voltage is applied to the V<sub>OCM</sub> pin, the DC common-mode output voltage will be set by the internal resistor divider to the midpoint of the voltages on the V<sub>CC</sub> and V<sub>EE</sub> pins. The input impedance of the V<sub>OCM</sub> pin is 50k $\Omega$ . The V<sub>OCM</sub> pin can be driven up to V<sub>CC</sub> - 1.5V and V<sub>EE</sub> + 1.5V. The V<sub>OCM</sub> pin should be bypassed to ground with a 0.1µF to 1µF capacitor. The V<sub>OCM</sub> pin should be connected to ground when the desired output common-mode voltage is ground reference. The value of the external capacitor has an effect on the PSRR performance of the LME49724. With the V<sub>OCM</sub> pin only bypassed with a low value capacitor, the PSRR performance of the LME49724 will be reduced, especially at low audio frequencies. For best PSRR performance, the V<sub>OCM</sub> pin should be connected to stable, clean reference. Increasing the value of the bypass capacitor on the V<sub>OCM</sub> pin will also improve PSRR performance.

# ENABLE FUNCTION

The LME49724 can be placed into standby mode to reduce system current consumption by driving the ENABLE pin below  $V_{EE}$  + 1.75V. The LME49724 is active when the voltage on the ENABLE pin is above  $V_{EE}$  + 2.35V. The ENABLE pin should not be left floating. For best performance under all conditions, drive the ENABLE pin to the  $V_{EE}$  pin voltage to enter standby mode and to ground for active operation when operating from split supplies. When operating from a single supply, drive the ENABLE pin to ground for standby mode and to  $V_{CC}$  for active mode.

#### www.ti.com

#### FULLY DIFFERENTIAL OPERATION

The LME49724 performs best in a fully differential configuration. The circuit shown in Figure 50 is the typical fully differential configuration.

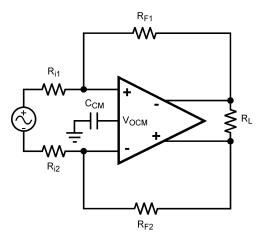

Figure 50. Fully Differential Configuration

The closed-loop gain is shown in Equation 1 below.

$$A_{V} = R_{F} / R_{i} \quad (V/V)$$

where

• R<sub>i1</sub> = R<sub>i2</sub>

• Using low value resistors will give the lowest noise performance

SINGLE-ENDED TO DIFFERENTIAL CONVERSION

For many applications, it is required to convert a single-ended signal to a differential signal. The LME49724 can be used for a high performance, simple single-to-differential converter. Figure 51 shows the typical single-to-differential converter circuit configuration.

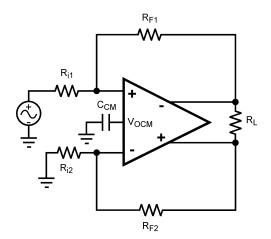

Figure 51. Single-Ended Input to Differential Output

Copyright © 2008–2013, Texas Instruments Incorporated

(1)

# SINGLE SUPPLY OPERATION

The LME49724 can be operated from a single power supply, as shown in Figure 52. The supply voltage range is limited to a minimum of 5V and a maximum of 36V. The common-mode output DC voltage will be set to the midpoint of the supply voltage. The  $V_{OCM}$  pin can be used to adjust the common-mode output DC voltage on the outputs, as described previously, if the supply voltage midpoint is not the desired DC voltage.

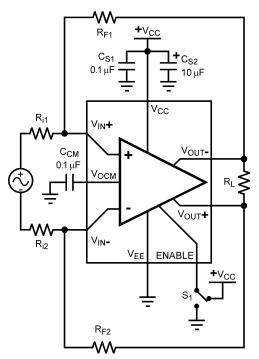

Figure 52. Single Supply Configuration

# DRIVING A CAPACITIVE LOAD

The LME49724 is a high speed op amp with excellent phase margin and stability. Capacitive loads up to 100pF will cause little change in the phase characteristics of the amplifiers and are therefore allowable.

Capacitive loads greater than 100pF must be isolated from the output. The most straightforward way to do this is to put a resistor in series with the output. This resistor will also prevent excess power dissipation if the output is accidentally shorted.

# THERMAL PCB DESIGN

The LME49724's high operating supply voltage along with its high output current capability can result in significant power dissipation. For this reason the LME49724 is provided in the exposed DAP SO PowerPad package for improved thermal dissipation performance compared to other surface mount packages. The exposed pad is designed to be soldered to a copper plane on the PCB which then acts as a heat sink. The thermal plane can be on any layer by using multiple thermal vias under and outside the IC package. The vias under the IC should have solder mask openings for the entire pad under the IC on the top layer but cover the vias on the bottom layer. This method prevents solder from being pulled away from the thermal vias during the reflow process resulting in optimum thermal conductivity.

Heat radiation from the PCB plane area is best accomplished when the thermal plane is on the top or bottom copper layers. The LME49724 should always be soldered down to a copper pad on the PCB for both optimum thermal performance as well as mechanical stability.

The exposed pad is for heat transfer and the thermal plane should either be electrically isolated or connected to the same potential as the  $V_{EE}$  pin. For high frequency applications (f > 1MHz) or lower impedance loads, the pad should be connected to a plane that is connected to the  $V_{EE}$  potential.

#### SUPPLY BYPASSING

The LME49724 should have its supply leads bypassed with low-inductance capacitors such as leadless surface mount (SMT) capacitors located as close as possible to the supply pins. It is recommended that a 10µF tantalum or electrolytic capacitor be placed in parallel with a 0.1µF ceramic or film type capacitor on each supply pin. These capacitors should be star routed with a dedicated ground return plane or large trace for best THD performance. Placing capacitors too far from the power supply pins, especially with thin connecting traces, can lead to excessive inductance, resulting in degraded high-frequency bypassing. Poor high-frequency bypassing can result in circuit instabilities. When using high bandwidth power supplies, the value and number of supply bypass capacitors should be reduced for optimal power supply performance.

### **BALANCE CABLE DRIVER**

With high peak-to-peak differential output voltage and plenty of low distortion drive current, the LME49724 makes an excellent balanced cable driver. Combining the single-to-differential configuration with a balanced cable driver results in a high performance single-ended input to balanced line driver solution.

Although the LME49724 can drive capacitive loads up to 100pF, cable loads exceeding 100pF can cause instability. For such applications, series resistors are needed on the outputs before the capacitive load.

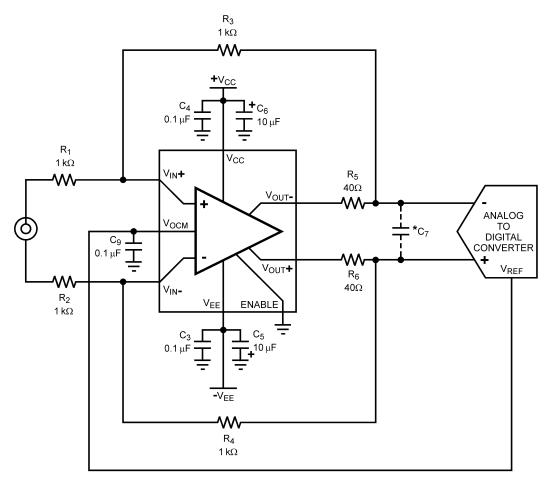

# ANALOG-TO-DIGITAL CONVERTER (ADC) APPLICATION

Figure 53 is a typical fully differential application circuit for driving an analog-to-digital converter (ADC). The additional components of  $R_5$ ,  $R_6$ , and  $C_7$  are optional components and are for stability and proper ADC sampling. ADC's commonly use switched capacitor circuitry at the input. When the ADC samples the signal the current momentarily increases and may disturb the signal integrity at the sample point causing a signal glitch. Component  $C_7$  is significantly larger than the input capacitance of a typical ADC and acts as a charge reservoir greatly reducing the effect of the signal sample by the ADC. Resistors  $R_5$  and  $R_6$  decouple the capacitive load,  $C_7$ , for stability. The values shown are general values. Specific values should be optimized for the particular ADC loading requirements.

The output reference voltage from the ADC can be used to drive the V<sub>OCM</sub> pin to set the common-mode DC voltage on the outputs of the LME49724. A buffer may be needed to drive the LME49724's V<sub>OCM</sub> pin if the ADC cannot drive the 50k $\Omega$  input impedance of the V<sub>OCM</sub> pin.

In order to minimize circuit distortion when using capacitors in the signal path, the capacitors should be comprised of either NPO ceramic, polystyrene, polypropylene or mica composition. Other types of capacitors may provide a reduced distortion performance but for a cost improvement, so capacitor selection is dependent upon design requirements. The performance/cost tradeoff for a specific application is left up to the user.

\* Value is application and converted dependent.

# DISTORTION MEASUREMENTS

The vanishing low residual distortion produced by the LME49724 is below the capabilities of commercially available equipment. This makes distortion measurements more difficult than simply connecting a distortion meter to the amplifier's inputs and outputs. The solution, however, is quite simple: an additional resistor. Adding this resistor extends the resolution of the distortion measurement equipment.

The LME49724's low residual distortion is an input referred internal error. As shown in Figure 54, adding a resistor connected between the amplifier's inputs changes the amplifier's noise gain. The result is that the error signal (distortion) is increased. Although the amplifier's closed-loop gain is unaltered, the feedback available to correct distortion errors is reduced, which means that measurement resolution increases. To ensure minimum effects on distortion measurements, keep the value of  $R_5$  low. The distortion reading on the audio analyzer must be divided by a factor of  $(R_3 + R_4)/R_5$ , where  $R_1 = R_2$  and  $R_3 = R_4$ , to get the actual measured distortion of the device under test. The values used for the LME49724 measurements were  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4 = 1k\Omega$  and  $R_5 = 20\Omega$ .

This technique is verified by duplicating the measurements with high closed-loop gain and/or making the measurements at high frequencies. Doing so produces distortion components that are within the measurement equipment's capabilities.

SNAS438A - NOVEMBER 2008 - REVISED APRIL 2013

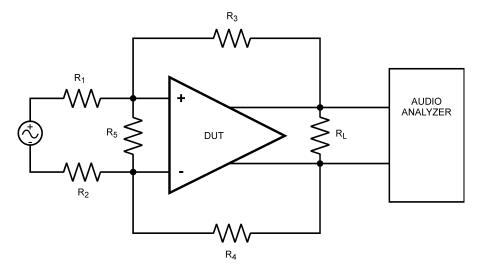

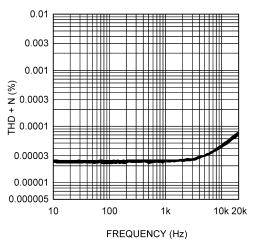

Figure 54. THD+N and IMD Distortion Test Circuit

### PERFORMANCE VARIATIONS

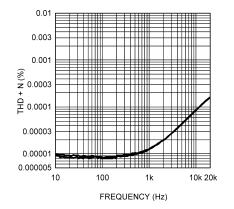

The LME49724 has excellent performance with little variation across different supply voltages, load impedances, and input configuration (single-ended or differential). Inspection of the THD+N vs Frequency and THD+N vs Output Voltage performance graphs (See Typical Performance Characteristics reveals only minimal differences with different load values. Figure 55 and Figure 56 below show the performance across different supply voltages with the same output signal level and load. Figure 55 has plots at ±5V, ±12V, ±15V, and ±18V with a  $3V_{RMS}$  output while Figure 56 has plots at ±12V, ±15V, and ±18V with a  $10V_{RMS}$  output. Both figures use a  $600\Omega$  load. The performance for each different supply voltage under the same conditions is so similar it is nearly impossible to discern the different plots lines.

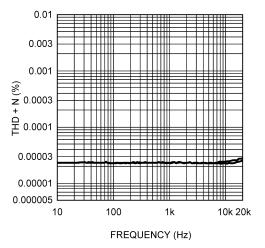

www.ti.com

Whether the input configuration is single-ended or differential has only a minimal affect on THD+N performance at higher audio frequencies or higher signal levels. For easy comparison, Figure 57 and Figure 58 are a combination of the performance graphs found in Typical Performance Characteristics.

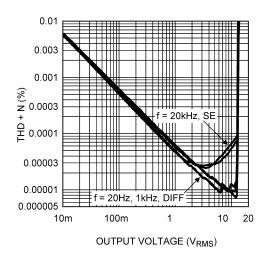

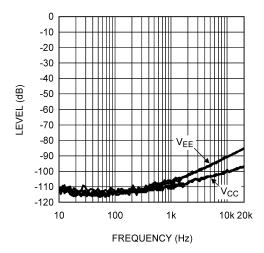

www.ti.com

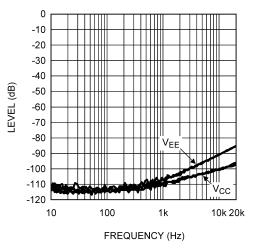

Power Supply Rejection Ratio does not vary with load value nor supply voltage. For easy comparison, Figure 59 and Figure 60 below are created by combining performance graphs found in Typical Performance Characteristics.

SNAS438A-NOVEMBER 2008-REVISED APRIL 2013

Although supply current may not be a critical specification for many applications, there is also no real variation in supply current with no load or with a  $600\Omega$  load. This is a result of the extremely low offset voltage, typically less than 1mV. Figure 61 shows the supply current under the two conditions with no real difference discernable.

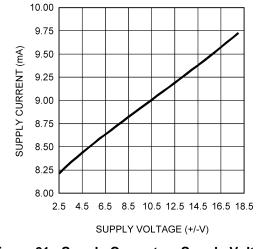

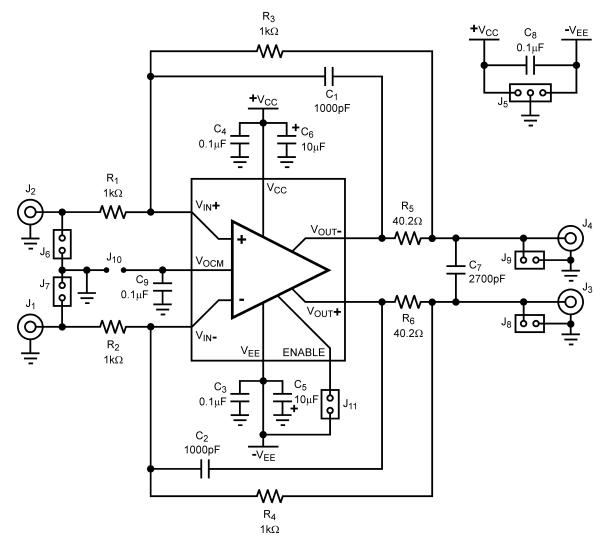

Figure 61. Supply Current vs Supply Voltage  $R_L$  = No Load and 600 $\Omega$

| Orderable Device | Status | Package Type | •       | Pins | -    | Eco Plan                   | Lead/Ball Finish | MSL Peak Temp       | Op Temp (°C) | Device Marking | Samples |
|------------------|--------|--------------|---------|------|------|----------------------------|------------------|---------------------|--------------|----------------|---------|
|                  | (1)    |              | Drawing |      | Qty  | (2)                        | (6)              | (3)                 |              | (4/5)          |         |
| LME49724MR/NOPB  | ACTIVE | SO PowerPAD  | DDA     | 8    | 95   | Green (RoHS<br>& no Sb/Br) | CU SN            | Level-3-260C-168 HR | -40 to 85    | L49724<br>MR   | Samples |
| LME49724MRX/NOPB | ACTIVE | SO PowerPAD  | DDA     | 8    | 2500 | Green (RoHS<br>& no Sb/Br) | CU SN            | Level-3-260C-168 HR | -40 to 85    | L49724<br>MR   | Samples |

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. **Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between

the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(<sup>6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

# PACKAGE OPTION ADDENDUM

30-Jun-2016

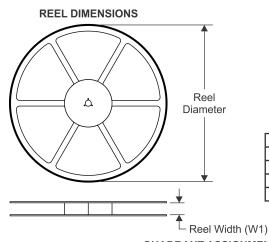

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- B. This drawing is subject to change without notice.
- C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.
- D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <a href="http://www.ti.com">http://www.ti.com</a>.
- E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
- F. This package complies to JEDEC MS-012 variation BA

PowerPAD is a trademark of Texas Instruments.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
