

TPS7A3501 High PSRR, Low-Noise, 1-A Power Filter

1 Features

- Regulates Input-to-Output Voltage:
 - User-Programmable Input-to-Output Voltage Regulation Range: 200 mV to 500 mV
- Power-Supply Rejection Ratio:
 - 42 dB at 1 MHz
 - ≥ 32 dB (360 kHz to 3.9 MHz)
- Low-Noise Output:
 - 3.8 μV_{RMS} (10 Hz to 100 kHz)
- Output Current: Up to 1 A
- Output Voltage Range: 1.21 V to 4.5 V
- Excellent Load Transient Response
- Stable With Ceramic Capacitors as Low as 10 μF
- Current Limit and Thermal Shutdown for Fault Protection
- Available in a Low Thermal Resistance Package: 2-mm × 2-mm WSON-6
- Operating Temperature Range: –40°C to 125°C

2 Applications

- Post DC-DC Converter Ripple Filtering
- Base Stations and Telecom Infrastructure
- Professional Audio
- Communications
- Imaging
- Test and Measurement
- Passive Filter Replacement

3 Description

The TPS7A3501 is a positive voltage, low-noise (3.8- μV_{RMS}) power filter capable of sourcing a 1-A load suitable for quiet supply solutions. Power filters, such as the TPS7A3501, provide voltage regulation across the input and output terminals with high efficiency (low insertion loss), and power-supply rejection. The device is ideally suited as a noise filter for 3.3-V, 2.5-V, and 1.8-V supplies at up to 1 A.

The input-to-output voltage regulation is also user-programmable, from 200 mV to 500 mV, with a single external resistor. If no resistor is used, the TPS7A3501 provides 330 mV of input-to-output voltage regulation. The device is stable with 10- μF input and output ceramic capacitors and a 10-nF noise-reduction ceramic capacitor.

The TPS7A3501 is fully specified over a wide temperature of –40°C to 125°C. The device is offered in a low thermal resistance, 2-mm × 2-mm, WSON-6 package. Unlike passive filters, the TPS7A3501 provides thermal and current protection for itself and surrounding circuitry.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|----------|-------------------|
| TPS7A3501 | WSON (6) | 2.00 mm × 2.00 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Pin Configuration and Functions

Pin Functions

| PIN | | I/O | DESCRIPTION |
|-----------|-----|-----|--|
| NAME | NO. | | |
| EN | 2 | I | Enable pin. Driving EN high turns on the device (if driven low, EN turns off the device). EN must not be left floating and can be connected to IN if not used. |
| GND | 3 | — | Ground |
| IN | 1 | I | Input supply. A capacitor greater than or equal to 10 μ F must be tied from this pin to ground to assure stability. This configuration is especially important when long input traces or high source impedances are encountered. TI recommends using X5R- or X7R-type dielectrics to minimize the temperature variations inherent to capacitors. |
| NR | 4 | O | Noise-reduction pin. When a capacitor is connected from this pin to GND, RMS noise can be reduced to very low levels. A capacitor greater than or equal to 10 nF must be tied from this pin to ground to assure stability. TI recommends connecting a 1- μ F capacitor from NR to GND (as close to the device as possible) to maximize AC performance and minimize noise. TI recommends using X5R- or X7R-type dielectrics to minimize the temperature variations inherent to capacitors. In addition, when a resistor is connected from this pin to GND or IN, the device input-to-output voltage can be programmed; see Feature Description for details. |
| OUT | 6 | O | Regulator output. A capacitor greater than or equal to 10 μ F must be tied from this pin to ground to assure stability. TI recommends using a X5R- or X7R-type dielectrics to minimize the temperature variations inherent to capacitors. |
| PowerPAD™ | — | — | Connect the PowerPAD to the ground plane for improved thermal performance. |
| SENSE | 5 | I | Control-loop error amplifier input. This pin must be connected to OUT. TI recommends connecting SENSE at the point of load to maximize accuracy. |

6 Specifications

6.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted).⁽¹⁾

| | | MIN | MAX | UNIT |
|-------------|---------------------------|--------------------|----------------------|------|
| Voltage | IN, NR, EN | −0.3 | 7 | V |
| | OUT, SENSE | −0.3 | $V_{IN} + 0.3^{(2)}$ | |
| Current | OUT | Internally limited | | |
| Temperature | Operating junction, T_J | −40 | 125 | °C |
| | Storage, T_{stg} | −55 | 150 | |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Absolute maximum rating is $V_{IN} + 0.3$ V or + 7 V, whichever is smaller.

6.2 ESD Ratings

| | | VALUE | UNIT |
|-------------------------------------|--|-------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾ | ±1000 | V |
| | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾ | ±250 | |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted).

| | | MIN | NOM | MAX | UNIT |
|-----------|--------------------------------|------|-----|-----|------|
| V_{IN} | Input voltage | 1.71 | | 5 | V |
| I_{OUT} | Output current | 0 | | 1 | A |
| T_J | Operating junction temperature | −40 | | 125 | °C |

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | DRV (WSN) | UNIT |
|-------------------------------|--|-----------|------|
| | | 6 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 66.9 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 86.5 | |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 36.4 | |
| Ψ_{JT} | Junction-to-top characterization parameter | 1.8 | |
| Ψ_{JB} | Junction-to-board characterization parameter | 36.6 | |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | 7.3 | |

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

At $T_J = -40^{\circ}\text{C}$ to 125°C , $V_{IN} = 3.6\text{ V}$, $R_{NR} = \infty$ (not connected), $I_{OUT} = 10\text{ mA}$, $V_{EN} = V_{IN}$, and $C_{IN} = C_{OUT} = 10\text{ }\mu\text{F}$, unless otherwise noted.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|----------------------------------|--|---|------|-----|-------------------------|
| V_{IN} | Input voltage range | 1.71 | | 5 | V |
| $V_{UVLO(in)}$ | Input supply UVLO | V_{IN} increasing | | 1.7 | V |
| | V_{IN} hysteresis | | 200 | | mV |
| V_{OUT} | Output voltage range | 1.21 | | 4.5 | V |
| $V_{IN} - V_{OUT}$ voltage range | | 200 | | 500 | mV |
| | $V_{OUT(nom)} = V_{IN} - 330\text{ mV}$, $I_{OUT} \leq 1\text{ A}$, $1.71\text{ V} \leq V_{IN} \leq 4.83\text{ V}$ | 297 | 330 | 363 | mV |
| | $R_{NR_INTERNAL}^{(1)}$ | 110 | 170 | 210 | k Ω |
| | $I_{NR_INTERNAL}^{(2)}$ | 1.4 | 1.8 | 2.4 | μA |
| $\Delta V_{OUT(\Delta I_{OUT})}$ | Load regulation | $10\text{ mA} \leq I_{OUT} \leq 1\text{ A}$ | 10 | | $\mu\text{V}/\text{mA}$ |
| I_{CL} | Output current limit | $V_{OUT} = 0.85 \times V_{OUT(nom)}$ | 1.1 | | A |
| I_{GND} | GND pin current | | 2.25 | 5 | mA |
| I_{EN} | EN pin input current | $V_{EN} = V_{IN}$ | 1 | 50 | nA |
| $I_{SHUTDOWN}$ | Shutdown current (I_{GND}) | $V_{EN} \leq 0.3\text{ V}$ | 0.01 | 3 | μA |
| PSRR | Power-supply rejection ratio | $f = 10\text{ kHz}$, $C_{NR} = 1\text{ }\mu\text{F}$, $I_{OUT} = 0.5\text{ A}$ | 55 | | dB |
| | | $f = 100\text{ kHz}$, $C_{NR} = 1\text{ }\mu\text{F}$, $I_{OUT} = 0.5\text{ A}$ | 40 | | |
| | | $f = 1\text{ MHz}$, $C_{NR} = 1\text{ }\mu\text{F}$, $I_{OUT} = 0.5\text{ A}$ | 42 | | |
| V_n | Output noise voltage | $BW = 10\text{ Hz to }100\text{ kHz}$, $C_{NR} = 1\text{ }\mu\text{F}$, $I_{OUT} = 1\text{ A}$ | 3.8 | | μV_{RMS} |
| | | $BW = 100\text{ Hz to }100\text{ kHz}$, $C_{NR} = 1\text{ }\mu\text{F}$, $I_{OUT} = 1\text{ A}$ | 3.62 | | |
| | | $BW = 10\text{ Hz to }1\text{ MHz}$, $C_{NR} = 1\text{ }\mu\text{F}$, $I_{OUT} = 1\text{ A}$ | 12.1 | | |
| $V_{EN(LO)}$ | EN pin input low (disable) | | | 0.4 | V |
| $V_{EN(HI)}$ | EN pin input high (enable) | | 1.1 | | V |
| T_{sd} | Thermal shutdown junction temperature | Shutdown, temperature increasing | 165 | | $^{\circ}\text{C}$ |
| | | Shutdown, temperature hysteresis | 20 | | |

- (1) $R_{NR_INTERNAL}$ refers to the internal resistor used to set ($V_{IN} - V_{OUT}$) for the device when no external R_{NR} is used. See [Adjustable Voltage Drop](#) and [Typical Application Circuit](#) for details.
- (2) $I_{NR_INTERNAL}$ refers to the internal current source used to set ($V_{IN} - V_{OUT}$) for the device when no external R_{NR} is used. See [Adjustable Voltage Drop](#) and [Typical Application Circuit](#) for details.

6.6 Typical Characteristics

At $V_{IN} = 3.6\text{ V}$, $R_{NR} = \infty$ (not connected), $I_{OUT} = 10\text{ mA}$, $V_{EN} = V_{IN}$, $C_{OUT} = 10\text{ }\mu\text{F}$, $C_{IN} = 10\text{ }\mu\text{F}$, and $C_{NR} = 0.1\text{ }\mu\text{F}$, unless otherwise noted.

7 Detailed Description

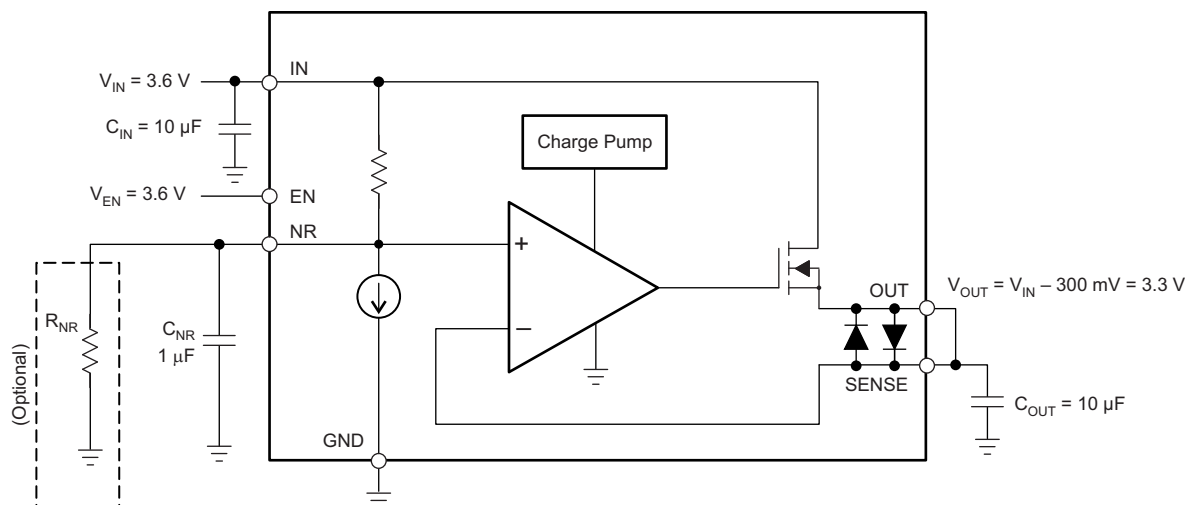

7.1 Overview

The TPS7A3501 is a positive-voltage, low-noise ($3.8\text{-}\mu\text{V}_{\text{RMS}}$) power filter capable of sourcing a 1-A load. Power filters such as the TPS7A3501 provide voltage regulation across the input and output terminals with high accuracy and power-supply rejection ratio. The device is ideally suited as a noise filter for 4.5-V, 3.3-V, and 1.8-V supplies up to 1-A loads.

The input-to-output voltage drop is also user-programmable, from 200 mV up to 500 mV, with an external resistor. If no resistor is used, the TPS7A3501 provides 330 mV of input-to-output voltage regulation.

The TPS7A3501 is stable with 10- μF ceramic input and output capacitors and a 10-nF ceramic noise-reduction capacitor. The device is fully specified over a wide temperature range of -40°C to 125°C and is offered in a low thermal resistance, 2-mm \times 2-mm, 6-pin WSON package.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Power Filter Operation

A power filter is very similar to a low-dropout (LDO) regulator, except that instead of regulating output voltage relative to ground, the power filter regulates output voltage relative to V_{IN} . In other words, a power filter maintains a fixed ΔV from input to output. The device is optimized for high PSRR with a low V_{IN} -to- V_{OUT} delta, leading to a lower power dissipation than standard LDOs. Unlike a standard LDO, the bandgap and noise associated with the device are never gained up, resulting in low output noise regardless of V_{OUT} . The external noise capacitor on the power filter lets the user set the frequency at which the power filter starts to reject noise from the input. [Table 1](#) summarizes the differences between a power filter and a high-performance LDO.

Table 1. Power Filter vs LDO Characteristics

| PARAMETER | POWER FILTER | LDO |
|--------------------|---|---|
| Voltage regulation | Regulates input-to-output delta. Voltage delta can be set from 0.2 V to 0.5 V. Relies on the upstream power rail to set the output voltage. | Regulates the output voltage referenced to ground. Outputs any output voltage within the output voltage range (limited by power dissipation). |
| PSRR | High PSRR at typical switching frequencies of DC-DC converters with lower power dissipation. Lower PSRR at low frequencies. | High PSRR over broad bandwidth. Effective rejection of low-frequency noise and switching noise from DC-DC. |
| Noise | Lower noise, 3.8 μV . Noise is not gained up when V_{OUT} increases. | Low noise (typically in the range of 5 μV_{RMS} to 20 μV_{RMS}). Noise is gained up when V_{OUT} increases. |
| Power dissipation | High PSRR can be achieved with only 330 mV from V_{IN} to V_{OUT} . | Typically requires 750 mV to 1 V of V_{IN} -to- V_{OUT} delta to achieve high PSRR. |

7.3.2 Minimum Load

The device is stable without an output load.

7.3.3 Shutdown

The enable pin (EN) is active high and compatible with standard and low-voltage TTL-CMOS levels. The enable pin voltage level is independent of input voltage and can be biased to a higher value than V_{IN} as long as EN is within the maximum specification. When shutdown capability is not required, EN can be connected to IN.

7.3.4 Internal Current Limit

The device has an internal foldback current limit that helps protect the power filter during fault conditions. The current supplied by the device is gradually reduced when the output voltage decreases. When the output is shorted to GND, the LDO supplies a typical current of 550 mA. When in current limit, the output voltage is not regulated and $V_{OUT} = I_{OUT} \times R_{LOAD}$. For reliable operation, do not operate the device in current limit for extended periods of time.

Because of the nature of the foldback current limit circuitry, if OUT is forced below 0 V before EN goes high, the device may not start up. To ensure proper start-up in applications that have both a positive and negative voltage rail, extra care must be taken to ensure that OUT is greater than or equal to 0 V. There are several ways to help ensure proper start-up for dual-rail applications:

- Enable the device before the negative rail and disable the device after the negative rail.
- Delaying the EN voltage with respect to IN voltage allows the internal pulldown resistor to discharge any residual voltage at OUT.
- If a faster discharge rate is required, or if EN is tied directly to IN, an external resistor from OUT to GND can be used.

7.3.5 Reverse Current

The TPS7A3501 has a built-in body diode that conducts current when the voltage at OUT exceeds the voltage at IN. This current is not internally limited, so if reverse voltage conditions are anticipated, external limiting is required.

If there are potential situations where reverse current is expected, place a diode from OUT to IN, as shown in [Figure 20](#).

Figure 20. Reverse Current Protection Schematic

7.3.6 Undervoltage Lockout (UVLO)

The device uses an undervoltage lockout circuit to keep the output shut off until the internal circuitry is operating properly, ensuring a well-controlled start-up.

7.3.7 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits device power dissipation, thus protecting the device from damage resulting from overheating.

Any activation of the thermal protection circuit indicates excessive power dissipation or inadequate thermal dissipation on the PCB. For reliable operation, limit junction temperature to 125°C (maximum). To estimate the margin of safety in a complete design, increase the ambient temperature until the thermal protection is triggered using worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least 35°C above the maximum expected ambient condition of the application. This configuration produces a worst-case junction temperature of 125°C at the highest-expected ambient temperature and worst-case load.

The device internal protection circuitry is designed to protect against overload conditions. This circuitry is not intended to replace proper heat-sinking or thermal dissipation on the PCB. Continuously running the device into thermal shutdown degrades device reliability.

7.4 Device Functional Modes

Table 2 provides a quick comparison between the normal, dropout, and disabled modes of operation.

Table 2. Device Functional Mode Comparison

| OPERATING MODE | PARAMETER | | | |
|----------------|----------------------------|---------------------------------------|------------------------------------|----------------------------------|
| | V _{IN} | EN | I _{OUT} | T _J |
| Normal | 1.71 ≤ V _{IN} ≤ 5 | V _{EN} > V _{EN(HI)} | I _{OUT} < I _{CL} | T _J < T _{sd} |
| Disabled | — | V _{EN} < V _{EN(LO)} | — | T _J > T _{sd} |

7.4.1 Normal Operation

The device functions as a fixed voltage drop filter under the following conditions:

- The input voltage is within the specified operating range of 1.71 V to 5 V.
- The enable voltage has previously exceeded the enable rising threshold voltage and not yet decreased below the enable falling threshold.
- The output current is less than the current limit (I_{OUT} < I_{CL}).
- The device junction temperature is less than the thermal shutdown temperature (T_J < T_{sd}).

7.4.2 Disabled

The device is disabled under the following conditions:

- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature ($T_J > T_{sd}$).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS7A3501 is well-suited for use as a filter for switching power supplies. The high PSRR of the device significantly reduces the ripple caused by the switching frequency as well as the subsequent harmonic frequencies. [Figure 21](#) shows the basic circuit connections for the TPS7A3501. The IN pin should be connected to a well-regulated power source, typically a switching power supply.

(1) Refer to [Table 4](#).

Figure 21. Basic Circuit Connections

8.2 Typical Application

[Figure 22](#) shows a schematic for filtering the output of a switching regulator using the TPS7A3501 to power an analog-to-digital converter (ADC).

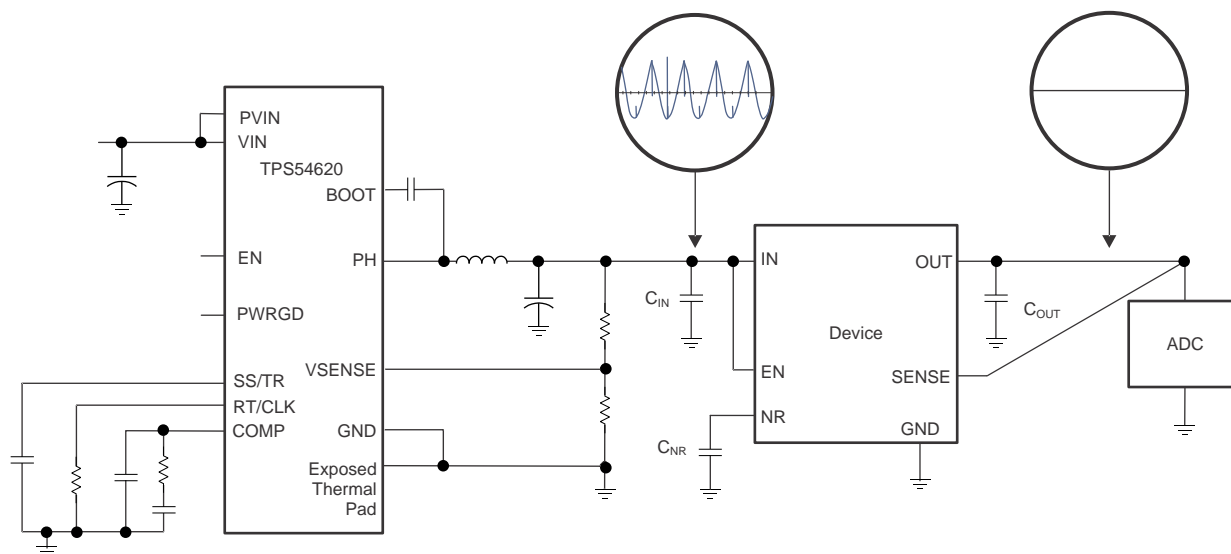

Figure 22. Typical Application Schematic

Typical Application (continued)

8.2.1 Design Requirements

Table 3 shows the design requirements.

Table 3. Design Requirements

| PARAMETER | DESIGN REQUIREMENT |
|-----------------------------|--------------------------------|
| Input voltage | 3.63 V |
| Output voltage | 3.3 V |
| 100-Hz to 100-kHz RMS noise | < 4 μV_{RMS} |
| Maximum output current | 700 mA |

8.2.2 Detailed Design Procedure

Select the input and output capacitors to be at least 10 μF for stability. Select a value for R_{NR} to give the desired voltage drop. For this example of a 330-mV voltage drop, no external resistor on the NR pin is required. Pick a value for C_{NR} greater than 10 nF, but large enough to provide the required noise performance. Refer to Table 5 for guidelines on selecting C_{NR} for a desired RMS noise target. For this example, to achieve an RMS noise (100 Hz to 100 kHz) less than 4 μV_{RMS} , the noise reduction capacitor must be at least 1 μF .

8.2.2.1 Adjustable Voltage Drop

In the TPS7A3501, the nominal voltage drop (ΔV) from IN to OUT is 330 mV. ΔV can be adjusted from this nominal setting with an external resistor. By connecting a resistor from the NR pin to IN, ΔV can be decreased to as low as 200 mV. By connecting a resistor from the NR pin to GND, ΔV can be increased to as high as 500 mV. The ability to change ΔV allows for the creation of standard voltage rails from higher voltage rails (for example, 2.5 V from 3 V, 1.5 V from 1.8 V, and so forth).

By connecting a resistor from the NR pin to IN, ΔV can be decreased to as low as 200 mV. Use Equation 1 to determine the size of the resistor required to set ΔV .

$$R = \Delta\text{V} / (0.33 - \Delta\text{V}) \times 150,000 \, \Omega \quad (1)$$

By connecting a resistor from the NR pin to GND, ΔV can be increased to as high as 500 mV. Use Equation 2 to determine the size of the resistor required to set ΔV .

$$R = V_{\text{OUT}} / (\Delta\text{V} - 0.33) \times 150,000 \, \Omega \quad (2)$$

Table 4 lists the standard external resistor values required for different input-to-output voltage drops.

Table 4. Common Input-to-Output Voltage Drops

| ΔV (mV) | V_{OUT} | R TO V_{IN} | R TO GND |
|-----------------------|------------------|----------------------|----------------|
| 200 | Any | 240 k Ω | Do not install |
| 330 | Any | Do not install | Do not install |
| 400 | 3.3 V | Do not install | 6.8 M Ω |
| | 2.5 V | Do not install | 5.1 M Ω |

| | 1.8 V | Do not install | 1.6 M Ω |

8.2.2.2 Input and Output Capacitor Requirements

Ceramic 10- μF or larger input and output capacitors are required to assure proper device operation. This capacitor counteracts reactive source impedances, improving supply transient response and decreasing input ripple. Higher-value capacitors may be used if large, fast slew rate load transients are anticipated, or if the device is located several inches away from the power source. To assure correct device operation, there should be no more than 100 μF of capacitance on the output of the device, including capacitance from downstream bypass capacitors.

TI recommends X5R- and X7R-type ceramic capacitors because these types of capacitors have minimal variation in value and equivalent series resistance (ESR) overtemperature. Other types of capacitors, such as electrolytic or tantalum, can make the device unstable.

8.2.2.3 Output Noise

A 10-nF, or higher, noise-reduction capacitor is required to assure stability. Using a 1-μF ceramic capacitor minimizes output noise (see [Figure 13](#)). To assure correct device operation, a maximum capacitor of 2.2 μF can be connected to NR.

8.2.2.4 Power-Supply Rejection Ratio (PSRR)

Unlike standard LDOs, the TPS7A3501 PSRR is significantly affected by the noise-reduction capacitor. The larger the noise-reduction capacitor, the higher the PSRR is for frequencies below 10 kHz. Using a 1-μF ceramic capacitor maximizes PSRR.

One of the most compelling features of the TPS7A3501 is its high PSRR capabilities. The rejection ratio for this device is lower than standard LDOs at frequencies below 1 kHz but becomes higher at higher frequencies. For better low-frequency PSRR performance, a larger noise-reduction capacitor can be used. TI recommends connecting a 1-μF ceramic capacitor to NR to maximize PSRR (see [Figure 12](#)). A higher input-to-output voltage difference also increases the device rejection ratio. Although the device maximizes rejection ratio at 500 mV, high rejection ratio can still be achieved with as little as a 330-mV input-to-output voltage differential, unlike most standard LDOs.

8.2.2.5 Start-up

Because adding a noise-reduction capacitor leads to the formation of an RC filter, start-up time and the rate at which the device tracks V_{IN} are increased. Thus, consider the tradeoff between start-up time, noise, and PSRR when selecting a noise-reduction capacitor to use with the TPS7A3501. Use [Equation 3](#) to calculate the typical start-up time.

$$T_{\text{startup}} = 250,000 \times C_{NR} \text{ (s)} \quad (3)$$

[Table 5](#) shows the effect of various noise-reduction capacitors on RMS noise (with a 100-Hz to 100-kHz bandwidth), PSRR (at 1 kHz), and start-up time.

Table 5. Effect of Various Filter Capacitors

| FILTER CAPACITOR | RMS NOISE (BW 100 Hz to 100 kHz) | PSRR (at 1 kHz) | START-UP TIME (EN to 90% of V_{OUT}) |
|------------------|-------------------------------------|--------------------|--|
| 1 μF | 3.62 μV | 60 dB | 250 ms |
| 100 nF | 4.21 μV | 40 dB | 25 ms |
| 10 nF | 20.70 μV | 20 dB | 3 ms |

8.2.2.6 Transient Response

Increasing the size of the output capacitor reduces overshoot and undershoot magnitude during transients; however this size increase also slows the recovery from these transients.

8.2.3 Application Curves

8.3 Do's and Don'ts

Place at least 10-μF ceramic capacitors on both the IN and OUT pins of the device, as close as possible to the pins of the regulator.

Do not place the input or output capacitor more than 10 mm away from the regulator.

Connect a 10-nF or greater, low-equivalent series resistance (ESR) capacitor across the NR pin and GND of the regulator. Larger capacitors provide lower noise performance.

Do not use a capacitor larger than 2.2 μF on the NR pin.

Do not exceed the absolute maximum ratings.

9 Power Supply Recommendations

For best performance, connect a low-output impedance power supply directly to the IN pin of the device. Inductive impedances between the input supply and the IN pin create significant voltage excursions at the IN pin.

10 Layout

10.1 Layout Guidelines

Input and output capacitors should be placed as close to the device pins as possible. TI recommends that all components be on the same side of the printed-circuit-board (PCB) as the device. Using long, thin traces or vias to connect the device to external components is highly discouraged because this practice leads to parasitic inductances, which in turn degrade noise, PSRR, and transient response. For an example layout, refer to the *TPS7A3501EVM-547 Evaluation Module User Guide* ([SLVU921](#)).

10.2 Layout Example

Figure 25. PCB Layout Example (DRV Package)

10.3 Power Dissipation

Knowing the device power dissipation and proper sizing of the thermal plane connected to the tab or pad is critical to avoiding thermal shutdown and ensuring reliable operation. Device power dissipation depends on input voltage and load conditions and can be calculated with [Equation 4](#):

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (4)$$

Power dissipation can be minimized and greater efficiency can be achieved by using the lowest available voltage drop option of 200 mV. However, keep in mind that higher voltage drops result in better PSRR performance.

On the WSON (DRV) package, the primary conduction path for heat is through the exposed power pad to the PCB. To ensure the device does not overheat, connect the pad to ground with an appropriate amount of copper PCB area through vias.

The maximum power dissipation determines the maximum allowable junction temperature (T_J) for the device. Power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance (θ_{JA}) of the combined PCB and device package and the temperature of the ambient air (T_A), according to [Equation 5](#):

$$T_J = T_A + (\theta_{JA} \times P_D) \quad (5)$$

Unfortunately, this thermal resistance (θ_{JA}) is highly dependent on the heat-spreading capability of the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The θ_{JA} recorded in the table is determined by the JEDEC standard for PCB and copper-spreading area and is to be used only as a relative measure of package thermal performance. For a well-designed thermal layout, θ_{JA} is actually the sum of the package junction-to-case (bottom) thermal resistance (θ_{JCbot}) plus the thermal resistance contribution by the PCB copper.

10.4 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the power filter on a typical PCB board application. These metrics are not strictly speaking thermal resistances, but rather offer practical and relative means of estimating junction temperatures. These psi metrics are determined to be significantly independent of copper-spreading area. The key thermal metrics (Ψ_{JT} and Ψ_{JB}) are given in the table and are used in accordance with [Equation 6](#).

$$\Psi_{JT}: T_J = T_T + \Psi_{JT} \times P_D$$

$$\Psi_{JB}: T_J = T_B + \Psi_{JB} \times P_D$$

where:

- P_D is the power dissipated as explained in [Equation 4](#),
 - T_T is the temperature at the center-top of the device package, and
 - T_B is the PCB surface temperature measured 1 mm from the device package and centered on the package edge.
- (6)

11 Device and Documentation Support

11.1 Device Support

11.1.1 Development Support

11.1.1.1 Evaluation Modules

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TPS7A3501. The [TPS7A3501EVM-547 evaluation module](#) (and [related user guide](#)) can be requested at the Texas Instruments website through the product folder or purchased directly from [the TI eStore](#).

11.1.1.2 Spice Models

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS7A3501 is available through the product folder under *Tools & Software*.

11.2 Documentation Support

11.2.1 Related Documentation

- [TPS7A3501EVM-547 User's Guide, SLVU921](#).

11.3 Trademarks

PowerPAD is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|--------------------|------|----------------|----------------------------|-------------------------|----------------------|--------------|-------------------------|-------------------------|
| TPS7A3501DRVR | ACTIVE | WSO | DRV | 6 | 3000 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | SIQ | Samples |
| TPS7A3501DRVT | ACTIVE | WSO | DRV | 6 | 250 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | SIQ | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. - NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Small Outline No-Lead (SON) package configuration.
 -  D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.

THERMAL PAD MECHANICAL DATA

DRV (S-PWSON-N6)

PLASTIC SMALL OUTLINE NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

4206926/Q 04/15

NOTE: All linear dimensions are in millimeters

DRV (S-PWSON-N6)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for solder mask tolerances.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
