

TPS65705x PMU for Embedded Camera Module

1 Features

- Two 400-mA Step-Down Converters
- Up to 92% Efficiency
- V_{IN} Range for DC-DC Converter From 3.3 V to 6 V
- 2.25-MHz Fixed-Frequency Operation
- Power Save Mode at Light Load Current
- Output Voltage Accuracy in PWM Mode $\pm 1.5\%$
- 100% Duty Cycle for Lowest Dropout
- 180° Out-of-Phase Operation
- 1 General Purpose 200-mA LDO
- V_{IN} Range for LDO From 1.7 V to 6.0 V
- Available in a 16-Ball DSBGA (WCSP) With 0.5-mm Pitch

2 Applications

- Digital Cameras
- Portable Media Players
- Handheld Equipment

3 Description

The TPS65705x devices are small power management units targeted for embedded camera module or other portable low-power consumer-end equipments. The device contains two highly efficient step-down converters, a low dropout linear regulator, and additional supporting functions. The 2.25-MHz step-down converter enters a low-power mode at light load for maximum efficiency across the widest possible range of load currents. For low-noise applications, the device can be forced into fixed-frequency PWM mode using the MODE pin. The device allows the use of small inductors and capacitors to achieve a small sized solution. The TPS65705x provides an output current of up to 400 mA on both DC-DC converters and integrates one 200-mA LDO with different output settings. The LDO operates with an input voltage range from 1.7 V to 6 V, thus allowing it to be supplied from the output of the step-down converter or directly from the system voltage.

The TPS65705x comes in a small 16-pin wafer chip scale package (WCSP) with 0.5-mm ball pitch.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|------------|-------------------|
| TPS657051 | DSBGA (16) | 2.08 mm x 2.08 mm |
| TPS657052 | | |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Pin Functions

| PIN | | I/O | DESCRIPTION |
|-------------------|--------|-----|---|
| NO. | NAME | | |
| A1 | VLDO | O | Output voltage from LDO |
| A2 | AGND | — | Analog ground |
| A3 | VINLDO | I | Input voltage pin for LDO |
| A4 ⁽¹⁾ | VCC | I | Supply Input for internal reference, has to be connected to VIN1/ VIN2 |
| B1 ⁽²⁾ | VIN1 | I | Input voltage pin for buck converter 1 |
| B2 | EN1 | I | Actively high enable input voltage for buck converter 1 |
| B3 | EN2 | I | Actively high enable input voltage for buck converter 2 |
| B4 ⁽²⁾ | VIN2 | I | Input voltage pin for buck converter 2 |
| C1 | L1 | O | Switch output from buck converter 1 |
| C2 | ENLDO | I | Actively high enable input voltage for LDO |
| C3 | MODE | I | Set low to enable Power Save Mode. Pulling this PIN to high forces the device to operate in PWM mode over the whole load range. |
| C4 | L2 | O | Switch output from buck converter 2 |
| D1 | PGND1 | — | Power ground |
| D2 | FB1 | I | Feedback input from buck converter 1 |
| D3 | FB2 | I | Feedback input from buck converter 2 |
| D4 | PGND2 | — | Power ground |

- (1) VCC must be the highest input for the device to function correctly.
 (2) VIN1/VIN2 must be connected to VCC.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|---|--------------------------|---|-----|------|
| Input voltage on all pins except A/PGND pins with respect to AGND | | -0.3 | 7 | V |
| Voltage on pin VLDO1 with respect to AGND | | -0.3 | 3.6 | V |
| Current | L1, VLDO1, VINLDO1, PGND | | 600 | mA |
| | AGND | | 20 | mA |
| | All other pins | | 3 | mA |
| Continuous total power dissipation | | See Dissipation Ratings | | |
| Operating free-air temperature, T _A | | -40 | 85 | °C |
| Maximum junction temperature, T _J | | | 125 | °C |
| Storage temperature, T _{stg} | | -65 | 150 | °C |

7.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|
| V _(ESD) | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±500 |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|------------------|---|-----|-----|-----|--------------|
| $V_{IN1/2}$ | Input voltage for step-down converter DCDC1 and DCDC2 | 3.3 | | 6 | V |
| $I_{OUTDCDC1/2}$ | Output current at L | | | 400 | mA |
| L | Inductor at L | 1.5 | 2.2 | 4.7 | μ H |
| V_{INLDO} | Input voltage for LDO | 1.7 | | 6.0 | V |
| I_{LDO} | Output current at LDO | | | 200 | mA |
| $C_{INDCDC1/2}$ | Input Capacitor at V_{IN1} and V_{IN2} | 4.7 | | | μ F |
| $C_{OUTDCDC1/2}$ | Output Capacitor at V_{OUT1} , V_{OUT2} | 4.7 | 10 | 22 | μ F |
| C_{INLDO} | Input Capacitor at V_{INLDO} | 2.2 | | | μ F |
| C_{OUTLDO} | Output Capacitor at V_{LDO} | 2.2 | | | μ F |
| T_A | Operating ambient temperature | -40 | | 85 | $^{\circ}$ C |

8 Detailed Description

8.1 Overview

The TPS65705x integrates fixed-output voltage, two highly efficient step-down converters, along with an LDO. Each regulator has dedicated input pins for easy control.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 DC-DC Converter

The TPS65705x step-down converter operates with typically 2.25-MHz fixed-frequency pulse width modulation (PWM) at moderate to heavy load currents. With MODE pin set to low, at light load currents the converter can automatically enter Power Save Mode and operates then in PFM mode.

During PWM operation the converter use a unique fast response voltage mode control scheme with input voltage feed-forward to achieve good line and load regulation allowing the use of small ceramic input and output capacitors. At the beginning of each clock cycle initiated by the clock signal, the high-side MOSFET switch is turned on. The current flows now from the input capacitor through the high-side MOSFET switch through the inductor to the output capacitor and load. During this phase, the current ramps up until the PWM comparator trips

Feature Description (continued)

and the control logic will turn off the switch. The current limit comparator will also turn off the switch in case the current limit of the high-side MOSFET switch is exceeded. After an off time preventing shoot through current, the low-side MOSFET rectifier is turned on and the inductor current will ramp down. The current flows now from the inductor to the output capacitor and to the load. It returns back to the inductor through the low-side MOSFET rectifier.

The next cycle will be initiated by the clock signal again turning off the low-side MOSFET rectifier and turning on the on the high-side MOSFET switch. The DCDC1 converter output voltage is set to 3.3 V and the DCDC2 converter output voltage is set to 1.8 V per default. A 180° phase shift between DCDC1 and DCDC2 decreases the input RMS current and synchronizes the operation of the two DC-DC converts. The FB pin must be directly connected to the output voltage of DC-DC and no external resistor network must be connected.

8.3.2 Power Save Mode

The Power Save Mode is enabled with Mode Pin set to low. If the load current decreases, the converter will enter Power Save Mode operation automatically. During Power Save Mode the converter skips switching and operates with reduced frequency in PFM mode with a minimum quiescent current to maintain high efficiency. The converter will position the output voltage typically +1% above the nominal output voltage. This voltage positioning feature minimizes voltage drops caused by a sudden load step. The transition from PWM mode to PFM mode occurs once the inductor current in the low-side MOSFET switch becomes zero, which indicates discontinuous conduction mode. During the Power Save Mode the output voltage is monitored with a PFM comparator. As the output voltage falls below the PFM comparator threshold of V_{OUT} nominal +1%, the device starts a PFM current pulse. The high-side MOSFET switch will turn on, and the inductor current ramps up. After the ON-time expires, the switch is turned off and the low-side MOSFET switch is turned on until the inductor current becomes zero. The converter effectively delivers a current to the output capacitor and the load. If the load is below the delivered current, the output voltage will rise. If the output voltage is equal or higher than the PFM comparator threshold, the device stops switching and enters a sleep mode with typical 25- μ A current consumption.

If the output voltage is still below the PFM comparator threshold, a sequence of further PFM current pulses are generated until the PFM comparator threshold is reached. The converter starts switching again once the output voltage drops below the PFM comparator threshold. With a fast single threshold comparator, the output voltage ripple during PFM mode operation can be kept small. The PFM Pulse is time controlled, which allows to modify the charge transferred to the output capacitor by the value of the inductor. The resulting PFM output voltage ripple and PFM frequency depend in first order on the size of the output capacitor and the inductor value. Increasing output capacitor values and inductor values will minimize the output ripple. The PFM frequency decreases with smaller inductor values and increases with larger values. The PFM mode is left and PWM mode is entered in case the output current can not longer be supported in PFM mode. The Power Save Mode can be disabled by setting Mode pin to high. The converter will then operate in fixed-frequency PWM mode.

8.3.2.1 Dynamic Voltage Positioning

This feature reduces the voltage under/overshoots at load steps from light to heavy load and vice versa. It is active in Power Save Mode and regulates the output voltage 1% higher than the nominal value. This provides more headroom for both the voltage drop at a load step, and the voltage increase at a load throw-off.

Feature Description (continued)

8.3.2.2 Soft Start

The step-down converter in TPS657051/52 has an internal soft start circuit that controls the ramp up of the output voltage. The output voltage ramps up from 5% to 95% of its nominal value within typical 250s. This limits the inrush current in the converter during ramp up and prevents possible input voltage drops when a battery or high impedance power source is used.

Figure 21. Soft Start

8.3.2.3 100% Duty Cycle Low Dropout Operation

The device starts to enter 100% duty cycle mode once the input voltage comes close to the nominal output voltage. In order to maintain the output voltage, the high-side MOSFET switch is turned on 100% for one or more cycles. With further decreasing V_{IN} the high-side MOSFET switch is turned on completely. In this case the converter offers a low input-to-output voltage difference. This is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range. The minimum input voltage to maintain regulation depends on the load current and output voltage, and can be calculated as:

$$V_{INmin} = V_{Omax} + I_{Omax} (R_{DS(on)max} + R_L)$$

where

- I_{Omax} = maximum output current plus inductor ripple current
 - $R_{DS(on)max}$ = maximum high-side switch R_{DSon}
 - R_L = DC resistance of the inductor
 - V_{Omax} = nominal output voltage plus maximum output voltage tolerance
- (1)

8.3.3 180° Out-of-Phase Operation

In PWM Mode the converters operate with a 180° turn-on phase shift of the PMOS (high-side) transistors. This prevents the high-side switches of both converters from being turned on simultaneously, and therefore smooths the input current. This feature reduces the surge current drawn from the supply.

8.3.3.1 Under-Voltage Lockout

The under voltage lockout circuit prevents the device from malfunctioning at low input voltages and from excessive discharge of the battery and disables the converters and LDOs. The under-voltage lockout threshold is typically 2.2 V.

8.3.4 Short-Circuit Protection

All outputs are short-circuit protected with a maximum output current as defined in the electrical specifications.

8.3.5 Thermal Shutdown

As soon as the junction temperature, T_J , exceeds typically 150°C for the DC-DC converter or LDO, the device goes into thermal shutdown. In this mode, the low-side and high-side MOSFETs are turned-off. The device continues its operation when the junction temperature falls below the thermal shutdown hysteresis again. A thermal shutdown for the LDO or the DC-DC converter will disable both power supplies simultaneously.

Feature Description (continued)

8.3.6 LDO

The low dropout voltage regulator is designed to operate well with low value ceramic input and output capacitors. It operates with input voltages down to 1.7 V. The LDO offers a maximum dropout voltage of 200 mV at rated output current. The LDO supports a current limit feature.

8.3.7 Enable for DCDC1, DCDC2 and LDO

Disabling the DC-DC converter or LDO, forces the device into shutdown, with a shutdown quiescent current as defined in [Electrical Characteristics](#). In this mode, the power FETs are turned-off and the entire internal control circuitry is switched-off.

8.4 Device Functional Modes

DCDC1, DCDC2, and LDO have dedicated enable pins. If all enable pins are pulled low the device will remain shutdown. If any of enable pins are pulled high corresponding regulators are enabled.

9 Application and Implementation

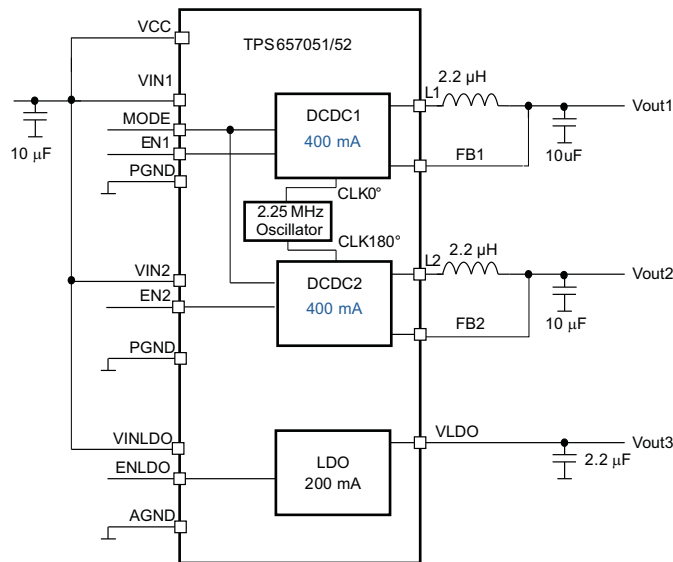

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TPS65705x device is designed for use as a power supply for embedded camera modules or other portable low-power equipment.

9.2 Typical Application

9.2.1 Design Requirements

For this design example, use the parameters listed in [Table 2](#) as the input parameters.

Table 2. Design Parameters

| DESIGN PARAMETER | VALUE |
|----------------------|--------------|
| Input Supply Voltage | 3.3 V to 6 V |
| Switching Frequency | 2.25 Mhz |

9.2.2 Detailed Design Procedure

9.2.2.1 Output Filter Design (Inductor and Output Capacitor)

9.2.2.1.1 Inductor Selection

The converter operates typically with 2.2-μH output inductor. Larger or smaller inductor values can be used to optimize the performance of the device for specific operation conditions. The selected inductor has to be rated for its DC resistance and saturation current. The DC resistance of the inductor will influence directly the efficiency of the converter. Therefore an inductor with lowest DC resistance should be selected for highest efficiency.

[Equation 2](#) calculates the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with [Equation 2](#). This is recommended because during heavy load transient the inductor current will rise above the calculated value.

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \quad (2)$$

$$I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2}$$

where

- f = Switching Frequency (2.25 MHz typical)
 - L = Inductor Value
 - ΔI_L = Peak-to-Peak inductor ripple current
 - I_{Lmax} = Maximum Inductor current
- (3)

The highest inductor current will occur at maximum V_{in} .

Open core inductors have a soft saturation characteristic and they can usually handle higher inductor currents versus a comparable shielded inductor.

A more conservative approach is to select the inductor current rating just for the maximum switch current of the corresponding converter. It must be considered, that the core material from inductor to inductor differs and will have an impact on the efficiency especially at high switching frequencies.

Notice that the step-down converter has internal loop compensation. As the internal loop compensation is designed to work with a certain output filter corner frequency calculated as follows:

$$f_c = \frac{1}{2\pi\sqrt{L \times C_{out}}} \quad \text{with } L = 2.2 \mu\text{H}, C_{out} = 10 \mu\text{F} \quad (4)$$

This leads to the fact the selection of external L-C filter has to be coped with the above formula. As a general rule of thumb the product of $L \times C_{out}$ should be constant while selecting smaller inductor or increasing output capacitor value.

Refer to [Table 3](#) and the typical applications for possible inductors.

Table 3. Tested Inductors

| INDUCTOR TYPE | INDUCTOR VALUE | SUPPLIER |
|---------------|-------------------|-------------|
| BRC1608 | 1.5 μH | Taiyo Yuden |
| MLP2012 | 2.2 μH | TDK |
| MIPSA2520 | 2.2 μH | FDK |
| LPS3015 | 2.2 μH | Coilcraft |
| LQM21P | 2.2 μH | Murata |

9.2.2.1.2 Output Capacitor Selection

The advanced Fast Response voltage mode control scheme of the step-down converter allows the use of small ceramic capacitors with a typical value of 10 μF , without having large output voltage under and overshoots during heavy load transients. Ceramic capacitors having low ESR values result in lowest output voltage ripple and are therefore recommended. For an inductor value of 2.2 μH , an output capacitor with 10 μF can be used. Refer to [Table 4](#).

If ceramic output capacitors are used, the capacitor RMS ripple current rating will always meet the application requirements. Just for completeness the RMS ripple current is calculated as:

$$I_{RMS_{Cout}} = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \times \frac{1}{2 \times \sqrt{3}} \quad (5)$$

At nominal load current the inductive converters operate in PWM mode and the overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor:

$$\Delta V_{out} = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \times \left(\frac{1}{8 \times C_{out} \times f} + ESR \right) \tag{6}$$

Where the highest output voltage ripple occurs at the highest input voltage V_{in} .

At light load currents the converter operates in Power Save Mode and the output voltage ripple is dependent on the output capacitor value. The output voltage ripple is set by the internal comparator delay and the external capacitor. The typical output voltage ripple is less than 1% of the nominal output voltage

9.2.2.1.3 Input Capacitor Selection

Because of the nature of the buck converter having a pulsating input current, a low ESR input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes. The converters need a ceramic input capacitor of 10 μF . The input capacitor can be increased without any limit for better input voltage filtering.

Table 4. Tested Capacitors

| TYPE | COMPONENT SUPPLIER | VALUE | VOLTAGE RATING | SIZE | MATERIAL |
|------------------------|------------------------------|-------------------|----------------|------|-------------|
| DC-DC Output Capacitor | Murata GRM155R60G475ME47D | 4.7 μF | 4 V | 0402 | Ceramic X5R |
| LDO I/O Capacitor | Murata GRM155R60J225ME15D | 2.2 μF | 6.3 V | 0402 | Ceramic X5R |
| DC-DC Output Capacitor | Murata GRM188R60J475K | 4.7 μF | 6.3 V | 0603 | Ceramic X5R |
| DC-DC I/O Capacitor | Murata GRM188R60J106M69D | 10 μF | 6.3 V | 0603 | Ceramic X5R |

9.2.3 Application Curves

10 Power Supply Recommendations

The device is optimized to be powered from single-cell Lithium battery. The input supply is required to stay above UVLO threshold without shutting down DC-DC converters. Power input pins of each regulator should be properly bypassed through ceramic capacitors that work best when placed close to the input pins as close as possible.

11 Layout

11.1 Layout Guidelines

- All input capacitors should be soldered as close as possible to the device.
- All inductors should be placed as close as possible to switching pins through thick trace.
- All feedback traces should be routed differentially and away from noisy traces such as switching signals.

11.2 Layout Example

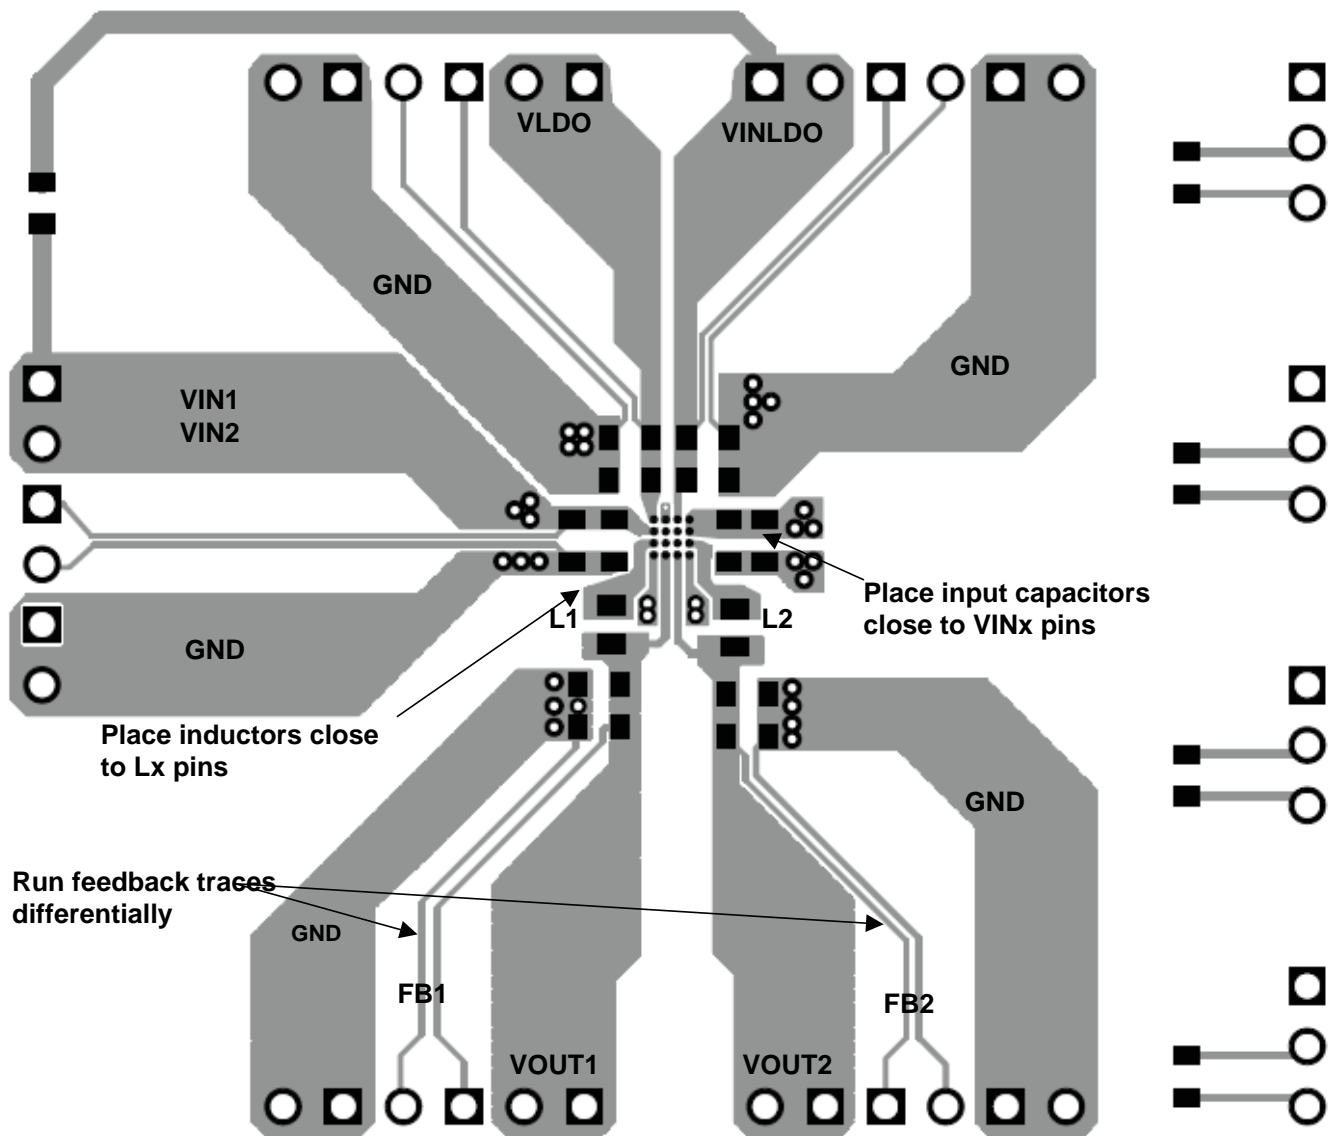

Figure 24. Layout Recommendation

12.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|-----------------|------|-------------|-------------------------|-------------------------|----------------------|--------------|-------------------------|-------------------------|
| TPS657051YZHT | ACTIVE | DSBGA | YZH | 16 | 250 | Green (RoHS & no Sb/Br) | SNAGCU | Level-1-260C-UNLIM | -40 to 85 | TPS657051 | Samples |
| TPS657052YZHR | ACTIVE | DSBGA | YZH | 16 | 3000 | Green (RoHS & no Sb/Br) | SNAGCU | Level-1-260C-UNLIM | -40 to 85 | TPS657052 | Samples |
| TPS657052YZHT | ACTIVE | DSBGA | YZH | 16 | 250 | Green (RoHS & no Sb/Br) | SNAGCU | Level-1-260C-UNLIM | -40 to 85 | TPS657052 | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
