### Description

The FSA8108 is an audio jack detection switch for 3- or 4-pole accessories that detects the audio plug connection. The FSA8108 detects volume up/down or send/end key presses. An LDO provides DC bias to microphone and remote key circuit in the accessory. For system flexibility, the FSA8108 features an I<sup>2</sup>C port with registers to allow programmability of AC timing specifications.

### Applications

- Cellular Phones, Smart Phones
- MP3 and PMP (Portable Media Player)

**Figure 2. Typical Application Diagram**

**Notes:**

2. A 1 kΩ resistor with a 2.2 µF capacitor is recommended for direct battery connection. This filter helps stabilize power rail events not associated with the FSA8039A. If power is supplied from a stable source, such as from a PMIC or LDO, a single 1 µF capacitor is recommended.
3. The J-DET is shorted to the left (L) audio channel when the headset or accessory plug is inserted into most audio jacks. Any external circuitry attached to the J-DET pin could affect audio performance in the 20-20 kHz range on the left channel.
4. The optional 10 kΩ resistor on the left channel is used to assist in detection of high-impedance accessories. This resistor has negligible impact on audio fidelity.

## Application Information

### Music Mode

When a 4-pole headset is inserted into the audio jack and a music/listening application is used, the MIC bias is normally enabled for headset button press detection (i.e. mute, volume change, etc.). This consumes power due to a constant path from the MIC bias resistor and microphone in the headset to GND. Fairchild has developed a Music Mode to enable the MIC switch periodically to monitor for a pressed button. This results in a power savings for battery-sensitive devices, such as cell phones or MP3 players. The FSA8108 enters Music Mode when the Music Mode Enable bit in CONTROL(0Ch) is set and a plug is inserted. Music Mode reduces MIC bias current by approximately 80% with the default Music Mode timing (09h) register value.

### LDO Operation

$$R_{VOL\ UP\ KEY\ MIN} = \frac{1}{\left(\frac{V_{BIAS\_MAX} - V_{TH\_KEY\_MIN}}{V_{TH\_KEY\_MIN}}\right) \frac{1}{R_{BIAS}} - \frac{1}{R_{MIC}}} = 132\Omega$$

$$R_{VOL\ UP\ KEY\ MAX} = \frac{1}{\left(\frac{V_{BIAS\_MIN} - V_{TH\_KEY\_MAX}}{V_{TH\_KEY\_MAX}}\right) \frac{1}{R_{BIAS}} - \frac{1}{R_{MIC}}} = 286\Omega$$

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

### Notes:

- A Fast-Mode I<sup>2</sup>C-Bus® device can be used in a Standard-Mode I<sup>2</sup>C-Bus system; but the requirement t<sub>SU;DAT</sub> ≥ 250 ns must be met. This is automatically the case if the device does not stretch the LOW period of the I2C\_SCL signal. If the device does stretch the LOW period of the I2C\_SCL signal, it must output the next data bit to the I2C\_SDA line t<sub>r,max</sub> + t<sub>SU;DAT</sub> = 1000 + 250 = 1250 ns (according to the Standard-Mode I<sup>2</sup>C Bus specification) before the I2C\_SCL line is released.
- C<sub>b</sub> equals the total capacitance of one BUS line in pF. If mixed with high-speed devices, faster fall times are allowed according to the I<sup>2</sup>C specification.
