16-bit Proprietary Microcontroller

CMOS

F²MC-16L MB90650A Series

MB90652A/653A/P653A/654A/F654A

■ DESCRIPTION

The MB90650A series are 16-bit microcontrollers designed for high speed real-time processing in consumer product applications such as controlling celluar phones, CD-ROMs, or VTRs. Based on the F²MC^{*1}-16L CPU core, an F²MC-16L is used as the CPU. This CPU includes high-level language-support instructions and robust task switching instructions, and additional addressing modes. In order to reduce the consumption current, dual-clock (main/sub) is used. Furthermore, low consumption power supply is achieved by using stop mode, sleep mode, watch mode, pseudo-watch mode, CPU intermittent operation mode.

Microcontrollers in this series have built-in peripheral resources including 10-bit A/D converter, 8-bit D/A converter, UART, 8/16-bit PPG, 8/16-bit up/down counter/timer, I²C interface⁻², 8/16-bit I/O timer (input capture, output compare, and 16-bit free-run timer).

- *1:F2MC stands for FUJITSU Flexible Microcontroller.
- *2:Purchase of Fujitsu I²C components conveys a license under the Philips I²C Patent Rights to use these components in an I²C system, provided that the system conforms to the I²C Standard Specification as defined by Philips.

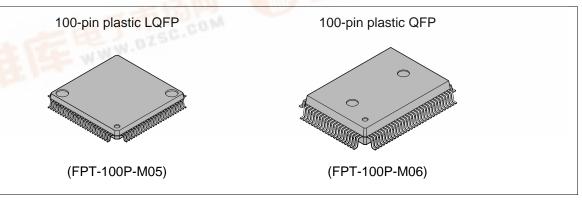

■ FEATURES

F²MC-16L CPU

- Minimum execution time: 62.5 ns/4 MHz oscillation (Uses PLL clock multiplication) maximum multiplier = 4
- Instruction set optimized for controller applications
 Object code compatibility with F²MC-16(H)

(Continued)

■ PACKAGE

(Continued)

Wide range of data types (bit, byte, word, and long word)

Improved instruction cycles provide increased speed

Additional addressing modes: 23 modes

High code efficiency

Access methods (bank access, linear pointer)

High precision operations are enhanced by use of a 32-bit accumulator

Extended intelligent I/O service (access area extended to 64 Kbytes)

Maximum memory space: 16 Mbytes

• Enhanced high level language (C) and multitasking support instructions

Use of a system stack pointer

Enhanced pointer indirect instructions

Barrel shift instructions

- Improved execution speed: Four byte instruction queue
- Powerful interrupt function
- Automatic data transfer function that does not use instruction (extended I²OS)

Notes: • MB90V650A device is assured only when operate with the tools, under the condition of power supply voltage: 2.7 V to 3.3 V, operating temparature: 0°C to 70°C and operating frequency: 1.5 MHz to 8MHz

[•] For more information about each package, see seciton "PACKAGE DIMENSIONS".

■ PIN ASSIGNMENT

■ PIN DESCRIPTION

| Pin | no. | | Circuit | | |
|-----------------------|--------------------|----------------------------|-------------|---|--|
| LQFP*1 | QFP*2 | Pin name | type | Function | |
| 80 | 82 | X0 | А | Crystal oscillator pin | |
| 81 | 83 | X1 | Α | Crystal oscillator pin | |
| 77 | 79 | X1A | В | Crystal oscillatort pins (32 kHz) | |
| 78 | 80 | X0A | В | Crystal oscillatort pins (32 kHz) | |
| 47 to 49 | 49 to 51 | MD0 to MD2 | D | Operating mode selection pins Connect directly to Vcc or Vss. | |
| 50 | 52 | TEST | D | Test input pin This pin must always be fixed to "H". | |
| 75 | 77 | RST | С | Reset input pin | |
| 83 to 90 | 85 to 92 | P00 to P07 | E (STBC) | General-purpose I/O ports Pull-up resistors can be set (RD07 to RD00 = "1") using the pull-up resistor setting register (RDR0). The setting does not apply for ports set as outputs (D07 to D0 = "1": invalid at the output setting). In external bus mode, the pins function as the lower data I/O olower address outputs (AD00 to AD07). | |
| | | AD00 to AD07 | | | |
| 91 to 98 | 93 to 100 | P10 to P17 | E (STBC) | General-purpose I/O ports Pull-up resistors can be set (RD17 to RD10 = "1") using the pull-up resistor setting register (RDR1). The setting does not apply for ports set as outputs (D17 to D10 = "1": invalid at the output setting). | |
| | | AD08 to AD15 | | In 16-bit external bus mode, the pins function as the upper data I/O or middle address outputs (AD08 to AD15). | |
| 99, 100, 1 to 6 | 1, 2, 3 to 8 | P20, P21, P22 to P27 | I (STBC) | General-purpose I/O ports In external bus mode, pins for which the corresponding bit in the HACR register is "0" function as the P20 to P27 pins. | |
| | | A16, A17, A18 to A23 | | In external bus mode, pins for which the corresponding bit in the HACR register is "1" function as the upper address output pins (A16 to A23). | |
| 7 | 9 | P30 | I (STBC) | General-purpose I/O port Functions as the ALE pin in external bus mode. | |
| | | ALE | | Functions as the address latch enable signal. | |
| 8 | 10 | P31 | I (STBC) | General-purpose <u>I/O</u> port Functions as the RD pin in external bus mode. | |
| | | RD | | Functions as the read strobe output (\overline{RD}) . | |
| 10 | 12 | P32 | I (STBC) | General-purpose <u>I/O port</u> Functions as the WRL pin in external bus mode if the WRE bit in the ECSR register is "1". | |
| | | WRL | | Functions as the lower data write strobe output (WRL). | |

*1: FPT-100P-M05

| Pin | no. | D' | Circuit | Function | | |
|-------------|-------|-------------|---|---|--|--|
| LQFP*1 | QFP*2 | Pin name | type | Function | | |
| 11 13 | | P33 | (STBC) | General-purpose I/O port Functions as the WRH pin in 16-bit external bus mode if the WRE bit in the ECSR register is "1". | | |
| | | WRH | | Functions as the upper data write strobe output (WRH). | | |
| 12 | 14 | P34 | I (STBC) | General-purpose I/O port Functions as the HRQ pin in external bus mode if the HDE bit in the ECSR register is "1". | | |
| | | HRQ | | Functions as the hold request input pin (HRQ). | | |
| 13 | 15 | P35 | (STBC) | General-purpose I/O port Functions as the HAK pin in external bus mode if the HDE bit in the ECSR register is "1". | | |
| | | HAK | | Functions as the hold acknowledge output (HAK) pin. | | |
| 14 16 | | P36 | (STBC) | General-purpose I/O port Functions as the RDY pin in external bus mode if the RYE bit in the ECSR register is "1". | | |
| | | RDY | | Functions as the external ready input (RDY) pin. | | |
| 15 17 | | P37 | I (STBC) | General-purpose I/O port Functions as the CLK pin in external bus mode if the CKE bit in the ECSR register is "1". | | |
| | | CLK | | Functions as the machine cycle clock output (CLK) pin. | | |
| 16 | 18 | P40 | H (STBC) | General-purpose I/O port When UART0 is operating, the data at the pin is used as the serial input (SIN0). Can be set as an open-drain output port (OD40 = "1") by the open-drain control register (ODR4). The setting does not apply for ports set as inputs (D40 = "0": invalid at the input setting). | | |
| | | SIN0 | | Functions as the UART0 serial input (SIN0). | | |
| 17 19 P41 C | | G (STBC) | General-purpose I/O port Functions as the SOT0 pin if the SOE bit in the UMC register is "1". Can be set as an open-drain output port (OD41 = "1") by the open-drain control register (ODR4). The setting does not apply for ports set as inputs (D41 = "0": invalid at the input setting). | | | |
| | | SOT0 | | Functions as the UART0 serial data output pin (SOT0). | | |

■ HANDLING DEVICES

1. Preventing Latch-up

Latch-up occurs in a CMOS IC if a voltage greater than Vcc or less than Vss is applied to an input or output pin or if the voltage applied between Vcc and Vss exceeds the rating.

If latch-up occurs, the power supply current increases rapidly resulting in thermal damage to circuit elements. Therefore, ensure that maximum ratings are not exceeded in circuit operation.

For the same reason, also ensure that the analog supply voltage does not exceed the digital supply voltage.

2. Treatment of Unused Pins

Leaving unused input pins unconnected can cause misoperation. Always pull-up or pull-down unused pins.

3. External Reset Input

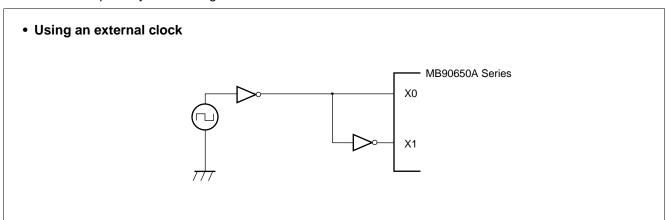

To reliably reset the controller by inputting an "L" level to the \overline{RST} pin, ensure that the "L" level is applied for at least five machine cycles. Take particular note when using an external clock input.

4. Vcc and Vss Pins

Ensure that all Vcc pins are at the same voltage. The same applies for the Vss pins.

5. Precautions when Using an External Clock

Drive the X0 pin only when using an external clock.

6. A/D Converter Power Supply and the Turn-on Sequence for Analog Inputs

Always turn off the A/D converter power supply (AVcc, AVRH, AVRL) and analog inputs (AN0 to AN7) before turning off the digital power supply (Vcc).

When turning the power on or off, ensure that AVRH does not exceed AVcc.

Also, when using the analog input pins as input ports, ensure that the input voltage does not exceed AVcc.

7. Turn-on Sequence for D/A Converter Power Supply

Always turn on the D/A converter power supply (DVR), after turning off the digital power supply (Vcc).

And in the turning off the power supply sequence always turn off the digital power supply (Vcc) after turning off the D/A converter power supply (DVR).

8. Initializing

In this device there are some kinds of inner resisters which are initialized only by power on reset. It is possible to initialize these resisters by turning on the power supply again.

9. Power Supply Pins

When there are several V_{CC} and V_{SS} pins, those pins that should have the same electric potential are connected within the device when the device is designed in order to prevent misoperation, such as latchup. However, all of those pins must be connected to the power supply and ground externally in order to reduce unnecessary emissions, prevent misoperation of strobe signals due to an increase in the ground level, and to observe the total output current standards.

In addition, give a due consideration to the connection in that current supply be connected to Vcc and Vss with the lowest possible impedance.

Finally, it is recommended to connect a capacitor of about 0.1 μ F between V_{CC} and V_{SS} near this device as a bypass capacitor.

10.Crystal Oscillation Circuit

Noise in the vicinity of the X0 and X1 pins will cause this device to operate incorrectly. Design the printed circuit board so that the bypass capacitor connecting X0, X1 and the crystal oscillator (or ceramic oscillator) to ground is located as close to the device as possible, and that the wiring does not closs the other wirings.

In addition, because printed circuit board artwork in which the area around the X0 and X1 pins is surrounded by ground provides stable operation, such an arrangement is strongly recommended.

11. About 2 Power Supplies

The MB90650A series usually uses the 3-V power supply as the main power source. With Vcc1 = 3 V and Vcc2 = 5 V, however, it can interface with P20 to P27, P30 to P37, P40 to P47, and P70 to P72 for the 5-V power supply separately from the 3-V power supply. Note, however, that the analog power supplies such as A/D and D/A can be used only as 3-V power supplies.

■ PROGRAMMING FOR MB90P653A

In EPROM mode, the MB90P653A functions equivalent to the MBM27C1000/1000A. This allows the EPROM to be programmed with a general-purpose EPROM programmer by using the dedicated socket adapter (do not use the electronic signature mode).

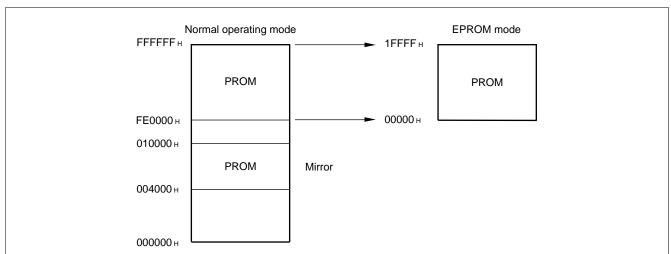

1. Program Mode

When shipped from Fujitsu, and after each erasure, all bits (128 K \times 8 bits) in the MB90P653A are in the "1" state. Data is written to the ROM by selectively programming "0" into the desired bit locations. Bits cannot be set to "1" electrically.

2. Programming Procedure

- (1) Set the EPROM programmer to MBM27C1000/1000A.
- (2) Load program data into the EPROM programmer at 00000H to 1FFFFH.

Note that ROM addresses FE0000H to FFFFFFH in the operation mode in the MB90P653A series assign to 00000H to 1FFFFH in the EPROM mode (on the EPROM programmer).

The 00 bank PROM mirror is 48 Kbytes. (This is a mirror for FF4000H to FFFFFFH.)

- (3) Mount the MB90P653A on the adapter socket, then fit the adapter socket onto the EPROM programmer. When mounting the device and the adapter socket, pay attention to their mounting orientations.
- (4) Start programming the program data to the device.
- (5) If programming has not successfully resulted, connect a capacitor of approx. 0.1 μF between Vcc and GND, between VPP and GND.

Note: The mask ROM products (MB90653A, MB90652A) does not support EPROM mode. Data cannot, therefore, be read by the EPROM programmer.

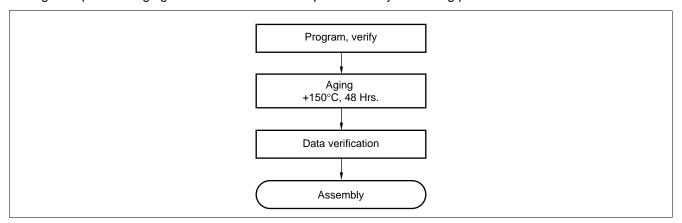

3. EPROM Programmer Socket Adapter

Inquiry: Sun Hayato Co., Ltd.: TEL: (81)-3-3986-0403 FAX: (81)-3-5396-9106

4. Recommended Screening Conditions

High temperature aging is recommended as the pre-assembly screening procedure.

5. Programming Yeild

MB90P653A cannot be write tested for all bits due to their nature. Therefore the write yield cannot always be guaranteed to be 100%.

6. EPROM Mode Pin Assignments

■ BLOCK DIAGRAM

■ MEMORY MAP

• MB90652, MB90653, MB90P653

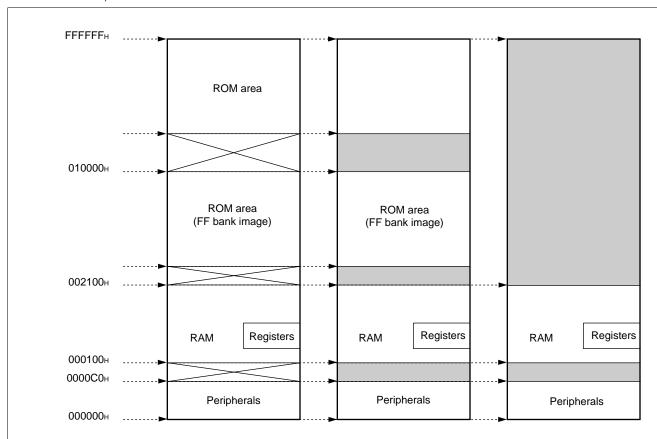

Notes: While the ROM data image of bank FF can be seen in the upper portion of bank 00, this is done only to permit effective use of the C compiler's small model. Because the lower 16 bits are the same, it is possible to reference tables in ROM without declaring the "far" specification in the pointer.

For example, to access to 00C000H is to access to the ROM content of FFC000H in practice.

Because the ROM area of FF bank exceeds 48 Kbytes, all the area can be seen in bank 00.

So, the image for FF4000H to FFFFFFH can be seen in bank 00, while FE0000H to FF3FFFH can only be seen in bank FF and FE.

About Programming

R/W: Readable and writable

R : Read only W : Write only

Explanation of initial values

- 0: The initial value of this bit is "0".
- 1: The initial value of this bit is "1".
- *: The initial value of this bit is "0" or "1".
- X: The initial value of this bit is undefined.
- -: This bit is not used. The initial value is undefined.

Note: Areas below address 0000FF_H not listed in the table are reserved areas. These addresses are accessed by internal access. No access signals are output on the external bus.

 [:] Indicates that the interrupt request flag is cleared by the I²OS interrupt clear signal.
 : Indicates that the interrupt request flag is cleared by the I²OS interrupt clear signal (stop request present).
 : Indicates that the interrupt request flag is not cleared by the I²OS interrupt clear signal.

Note: For resources in which two interrupt sources share the same interrupt number, the I2OS interrupt clear signal clears both interrupt request flags.

■ PERIPHERAL RESOURCES

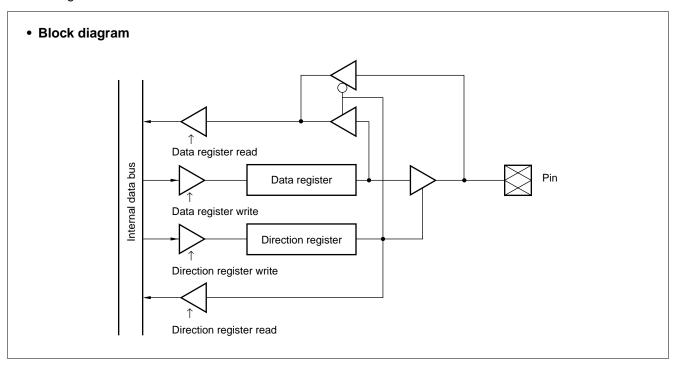

1. Parallel Ports

(1) I/O Ports

Each port pin can be specified as either an input or output by its corresponding direction register when the pin is not set for use by a peripheral. When a port is set as an input, reading the data register always reads the value corresponding to the pin level. When a port is set as an output, reading the data register reads the data register latch value. The same applies when reading using a read-modify-write instruction.

When used as control outputs, reading the data register reads the control output value, irrespective of the direction register value.

Note that if a read-modify-write instruction (set bit or similar instruction) is used to set output data in the data register before switching a pin from input to output, the instruction reads the input level at the pin and not the data register latch value.

(2) Port Direction Registers

(Continued)

- *: The operation of reading or writing to I/O ports is slightly different from reading or writing to memory, as follows.
 - Input mode

Read: Reads the corresponding pin level.

Write: Writes to the output latch.

Output mode

Read: Reads the value of the data register latch.

Write: The value is output from the corresponding pin.

When pins are used as ports, the register bits control the corresponding pins as follows.

0: Input mode

1: Output mode

Bits are set to "0" by a reset.

• P47, P70 to P72

No DDR for this port. Data is always available in this port, so when using P70 and P71 as I2C pin, set PDR value to "1". (Otherwise when using P70 and P71 by themselves, turn off the I2C.)

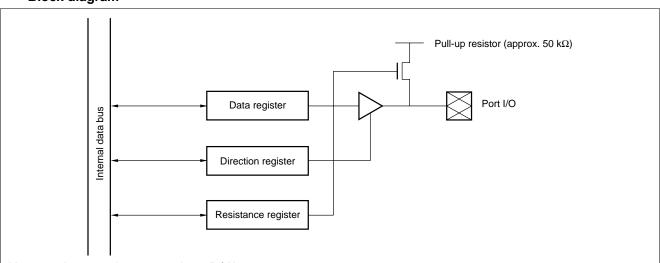

As this port is open-drain output style, so when using this port as an input port, in order to turn off the output transister, set the output data resister value to "1" and add the pull up resister to the external pin.

(4) Port Resistance Registers

• Register configuration

| R/W : Readable and writable | | | | | | | | | |

• Block diagram

Notes: • Input resistance register R/W

Controls the pull-up resistor in input mode.

- 0: Pull-up resistor disconnected in input mode.
- 1: Pull-up resistor connected in input mode.

The setting has no meaning in output mode (pull-up resistor disconnected).

The direction register (DDR) sets input or output mode.

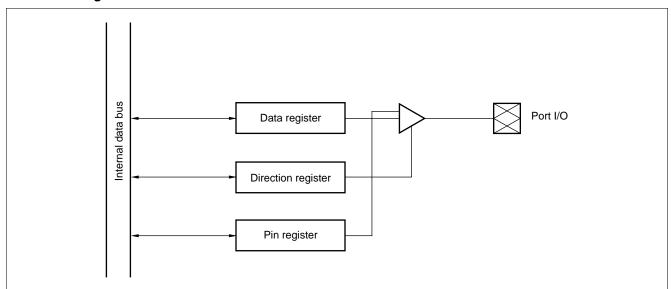

- The pull-up resistor is disconnected in hardware standby or stop mode (SPL = 1) (high impedance).
- This function is disabled when using an external bus mode. In this case, do not write to this register.

(5) Port Pin Register

Register configuration

• Port 4 pin register (ODR4) bit 7 bit 6 bit 5 bit 4 bit 3 bit 2 bit 1 bit 0 Initial value Access Address: 00001BH **OD46** OD45 OD44 OD43 OD42 OD41 **OD40** -0000000в R/W R/W: Readable and writable —: Unused

Block diagram

Notes: • Pin register R/W

Performs open-drain control in output mode.

- 0: Operate as a standard output port in output mode.
- 1: Operate as an open-drain output port in output mode.

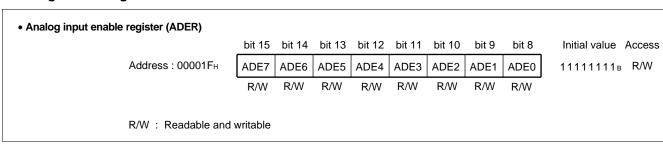

The setting has no meaning in input mode (output Hi-z).

The direction register (DDR) sets input or output mode.

• This function is disabled when using an external bus mode. In this case, do not write to this register.

(6) Analog Input Enable Register

• Register configuration

Controls each port 5 pin as follows.

0: Port input mode

1: Analog input mode

Set to "1" by a reset.

2. UART

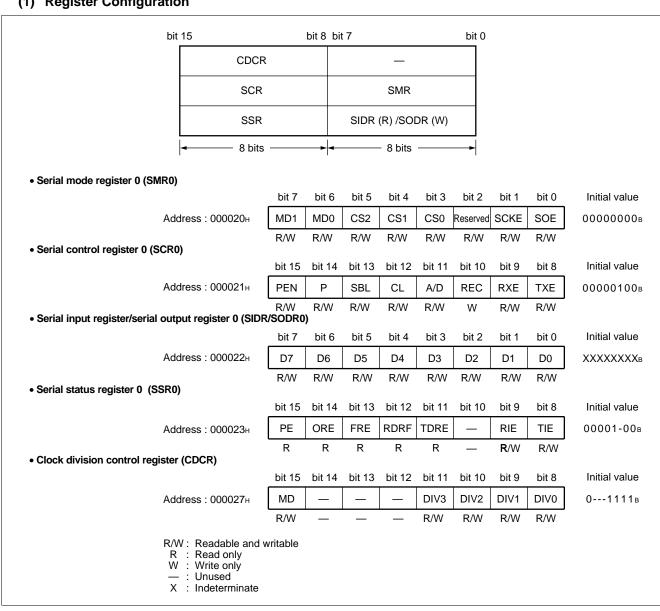

The UART is a serial I/O port that can be used for CLK asynchronous (start-stop synchronization) or CLK synchronous communications. The UART has the following features.

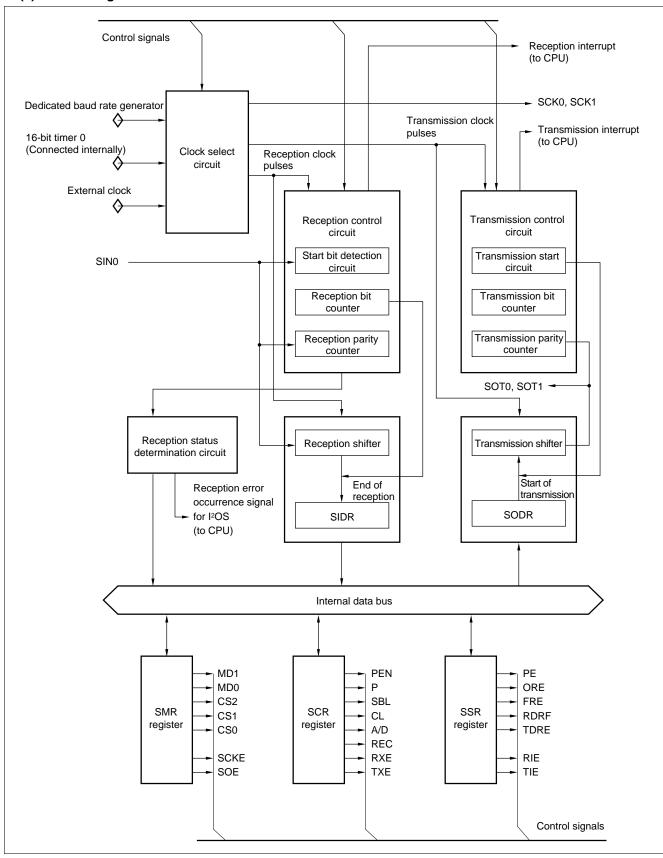

- Full duplex, double buffered
- Supports asynchronous (start-stop synchronization) and CLK synchronous data transfer
- Supports multi-processor mode
- Built-in dedicated baud rate generator

Asynchronous: 9615 bps, 31250 bps, 4808 bps, 2404 bps and 1202 bps For a 6, 8, 10, 12, or 16 MHz CLK synchronous: 1 Mbps, 500 kbps, 250 kbps, 125 kbps, 115.2 kbps and 62.5 kbps clock.

- Supports flexible baud rate setting using an external clock
- Error detect function (parity, framing, and overrun)
- NRZ type transmission signal
- Intelligent I/O service support

(1) Register Configuration

3. I/O Extended Serial Interface

I/O extended serial interface consists of an 8-bit serial I/O interface that can perform clock synchronous data transfer. Either LSB-first or MSB-first data transfer can be selected.

The following two serial I/O operation modes are available.

- Internal shift clock mode: Data transfer is synchronized with the internal clock.
- External shift clock mode: Data transfer is synchronized with the clock input from the external pin (SCK). By manipulating the general-purpose port that shares the external pin (SCK), this mode also enables the data transfer operation to be driven by CPU instructions.

(1) Register Details

• Serial mode control status register 0, 1 (SMCS0, SMCS1)

R/W: Readable and writable

R : Read only

— : Unused

X : Indeterminate

This register controls the transfer operation mode of the serial I/O. The following describes the function of each bit.

bit 3: Serial mode selection bit (MODE)

This bit selects the conditions for starting operation from the halted state. Changing the mode during operation is prohibited

| MODE | Operation |
|------|---|
| 0 | Start when STRT is set to "1". [Initial value] |
| 1 | Start on reading from or writing to the serial data register. |

The bit is initialized to "0" by a reset. The bit is readable and writable. Set to "1" when using the intelligent I/O service.

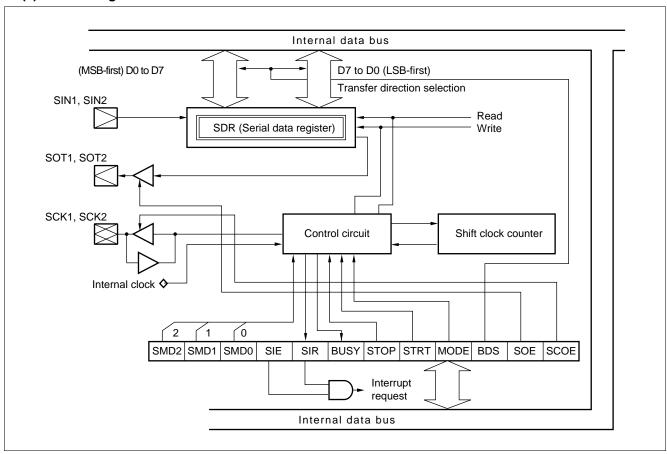

bit 2: Transfer direction selection bit (BDS: Bit Direction Select)

Selects as follows at the time of serial data input and output whether the data are to be transferred in the order from LSB to MSB or vice versa.

| MODE | Operation |
|------|---------------------------|
| 0 | LSB-first [Initial value] |
| 1 | MSB-first |

^{*1:} Only "0" can be written.

^{*2:} Only "1" can be written. Reading always returns "0".

4. A/D Converter

The A/D converter converts analog input voltages to digital values. The A/D converter has the following features.

• Conversion time: Minimum of 5.2 μs per channel (for a 16 MHz machine clock)

Uses RC-type successive approximation conversion with a sample and hold circuit.

• 10-bit resolution

• Eight program-selectable analog input channels

Single conversion mode: Selectively convert a one channel.

Scan conversion mode: Continuously convert multiple channels. Maximum of 8 program-

selectable channels.

Continuous conversion mode: Repeatedly convert specified channels.

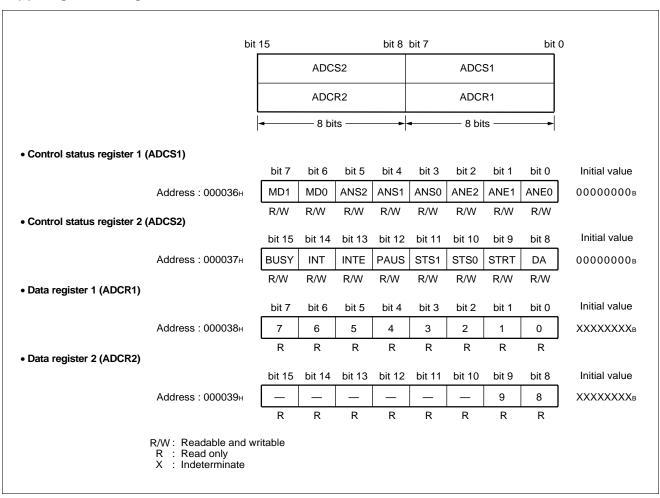

Stop conversion mode: Convert one channel then halt until the next activation. (Enables

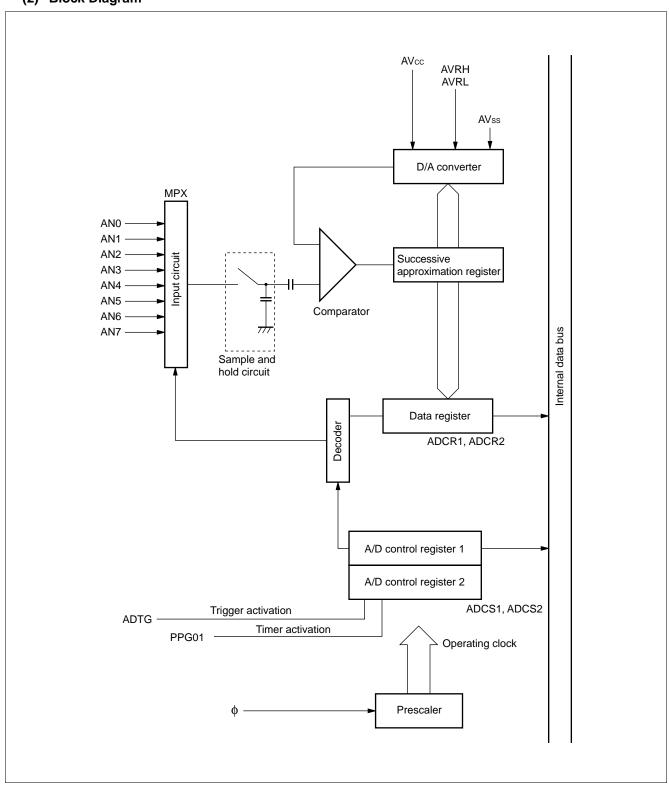

synchronization of the conversion start timing.)

 An A/D conversion completion interrupt request to the CPU can be generated on the completion of A/D conversion. This interrupt can activate I²OS to transfer the result of A/D conversion to memory and is suitable for continuous operation.

· Activation by software, external trigger (falling edge), or timer (rising edge) can be selected.

(1) Register Configuration

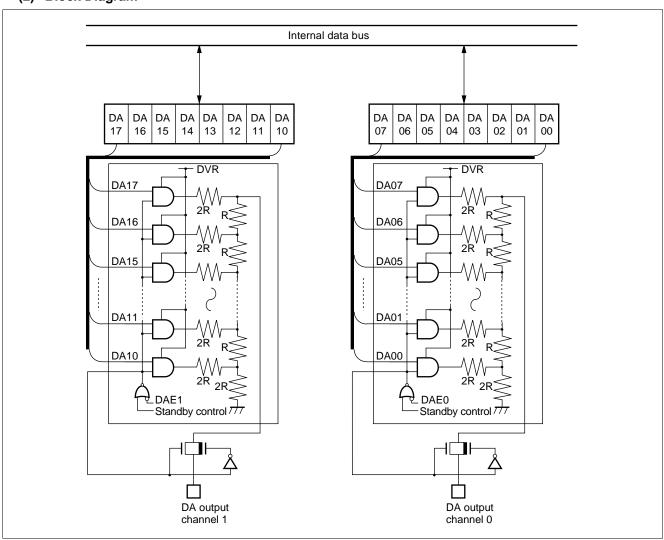

5. D/A Converter

D/A converter is an R-2R type D/A converter with 8-bit resolution. The device contains two D/A converters. The D/A control register controls the output of the two D/A converters independently.

(1) Register Configuration

| • D/A converter data register 0 (DAT0) | | | | | | | | | |

6. 8/16-bit PPG

8/16-bit PPG is an 8-bit reload timer module. The block performs PPG output in which the pulse output is controlled by the operation of the timer.

The hardware consists of two 8-bit down-counters, four 8-bit reload registers, one 16-bit control register, two external pulse output pins, and two interrupt outputs. The PPG has the following functions.

• 8-bit PPG output in two channels independent operation mode:

Two independent PPG output channels are available.

One 16-bit PPG output channel is available. 16-bit PPG output operation mode :

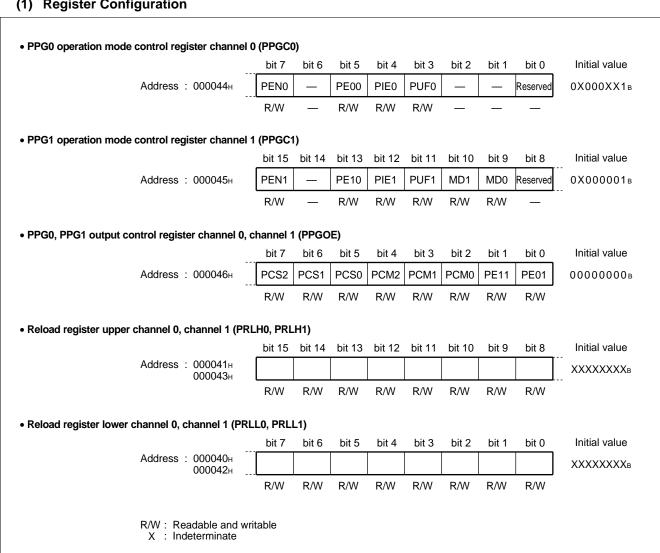

• 8 + 8-bit PPG output operation mode: Variable-period 8-bit PPG output operation is available by using the

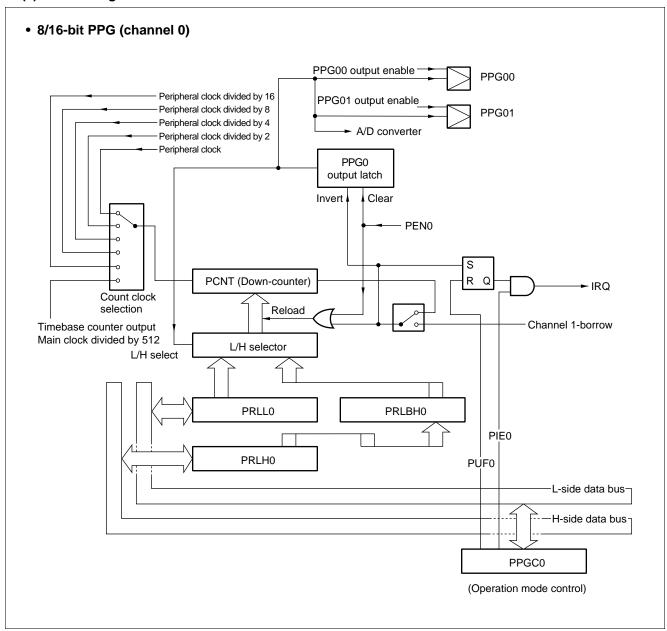

output of channel 0 as the clock input to channel 1.

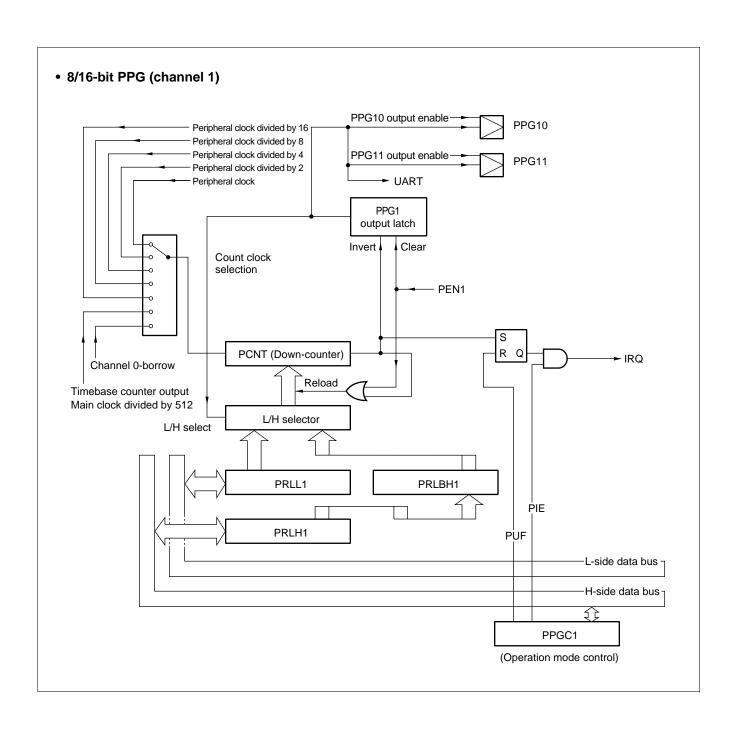

• PPG output operation : Outputs pulse waveforms with variable period and duty ratio. Can be

used as a D/A converter in conjunction with an external circuit.

(1) Register Configuration

7. 8/16-bit Up/Down Counter/Timer

8/16-bit up/down counter/timer is an up/down counter/timer and consists of six event input pins, two 8-bit up/down counters, two 8-bit reload/compare registers, and their control circuits.

(1) Main Functions

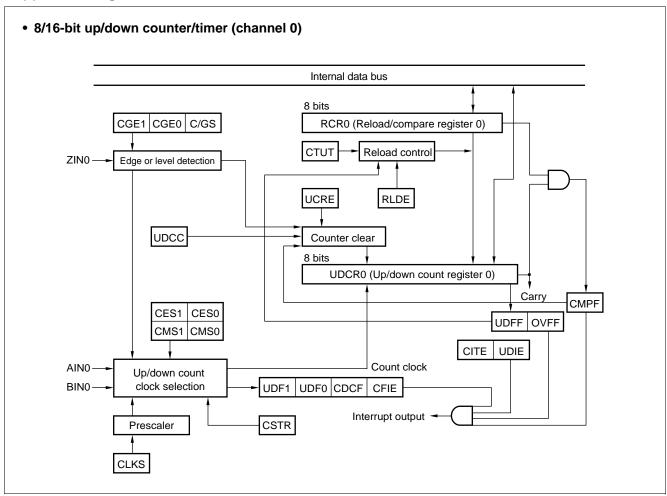

| | e 0 to 256 (or 0 to 65535 in 1 \times 16-bit operation mode). |

9. DTP/External Interrupts

The DTP (Data Transfer Peripheral) is a peripheral block that interfaces external peripherals to the F²MC-16L CPU. The DTP receives DMA and interrupt processing requests from external peripherals and passes the requests to the F²MC-16L CPU to activate the intelligent I/O service or interrupt processing. Two request levels ("H" and "L") are provided for the intelligent I/O service. For external interrupt requests, generation of interrupts on a rising or falling edge as well as on "H" and "L" levels can be selected, giving a total of four types.

(1) Register Configuration

10. 16-bit I/O Timer

The 16-bit I/O timer consists of one 16-bit free-run timer, two output compare, and two input capture modules. Based on the 16-bit free-run timer, these functions can be used to generate two independent waveform outputs and to measure input pulse widths and external clock periods.

• Register configuration

• Block diagram

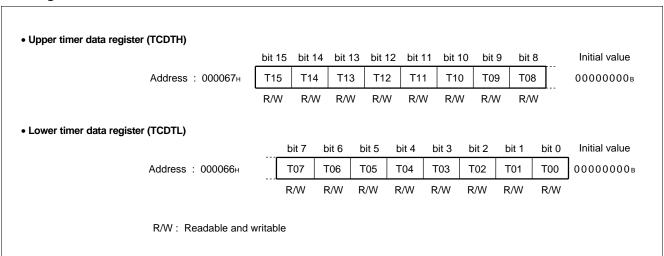

(1) 16-bit Free-run Timer

The 16-bit free-run timer consists of a 16-bit up-counter, a control register, and a prescaler. The output of the timer/counter is used as the base time for the input capture and output compare.

- The operating clock for the counter can be selected from four different clocks.
 Four internal clocks (φ/4, φ/16, φ/32, φ/64)
- Interrupts can be generated when a counter value overflow or compare match with compare register 0 occurs (the appropriate mode must be set for a compare match).
- The counter can be initialized to 0000_H by a reset, software clear, or compare match with compare register 0.

Register details

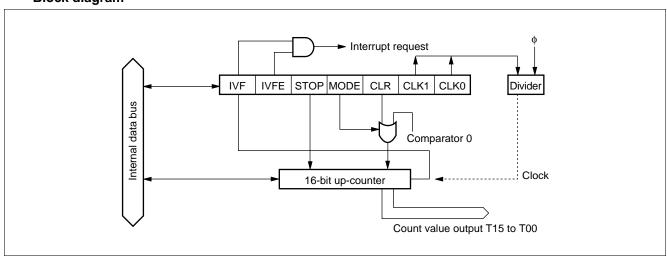

The count value of the 16-bit free-run timer can be read from this register. The count is cleared to " 0000_B " by a reset. Writing to this register sets the timer value. However, only write to the register when the timer is halted (STOP = "1"). Always use word access.

The 16-bit free-run timer is initialized by the following.

- Reset
- The clear bit (CLR) of the control status register
- A match between the timer/counter value and compare register 0 of the output compare (if the appropriate mode is set)

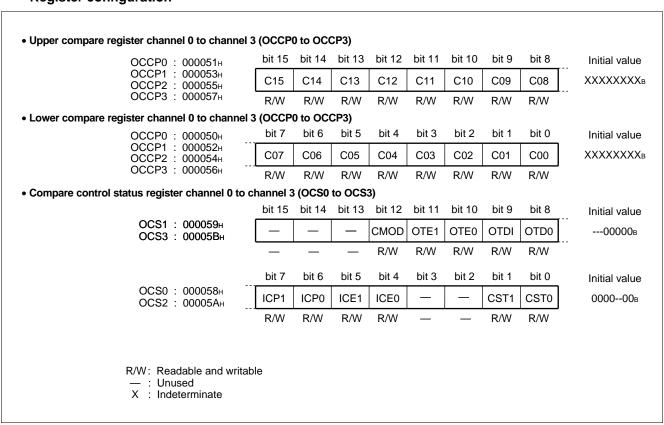

Block diagram

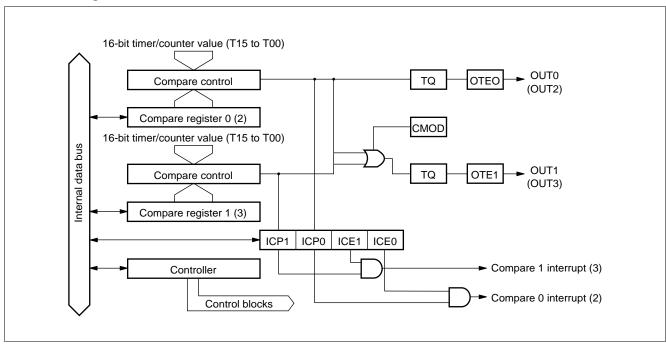

(2) Output Compare

The output compare consists of two 16-bit compare registers, compare output latches, and control registers. The modules can invert the output level and generate an interrupt when the 16-bit free-run timer value matches the compare register value.

- The four compare registers can be operated independently.
 Each compare register has a corresponding output pin and interrupt flag.
- The four compare registers can be paired to control the output pins. Invert the output pins using the four compare registers.
- Initial values can be set for the output pins.
- An interrupt can be generated when a compare match occurs.
- · Register configuration

• Block diagram

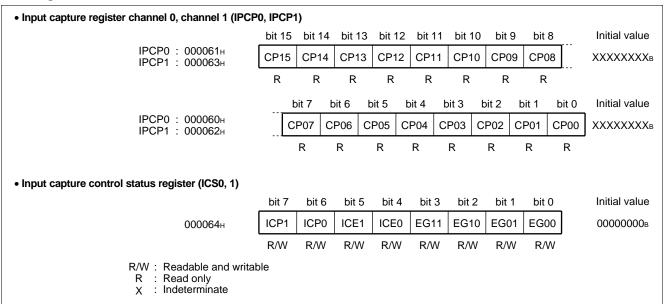

(3) Input Capture

The input capture consists of two independent external input pins, their corresponding capture registers, and a control register. The value of the 16-bit free-run timer can be stored in the capture register and an interrupt generated when the specified edge is detected on the signal from the external input pin.

- The edge to detect on the external input signal is selectable.
 Detection of rising edges, falling edges, or either edge can be specified.
- The two input capture channels can operate independently.
- An interrupt can be generated on detection of the specified edge on the external input signal.

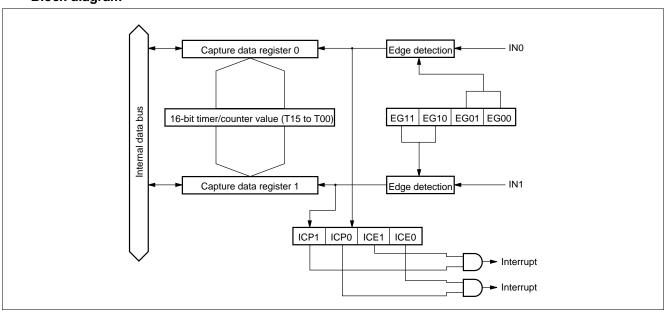

The input capture interrupt can activate the intelligent I/O service.

Register details

The 16-bit free-run timer value is stored in these registers when the specified edge is detected on the input waveform from the corresponding external pin. (Always use word access. Writing is prohibited.)

• Block diagram

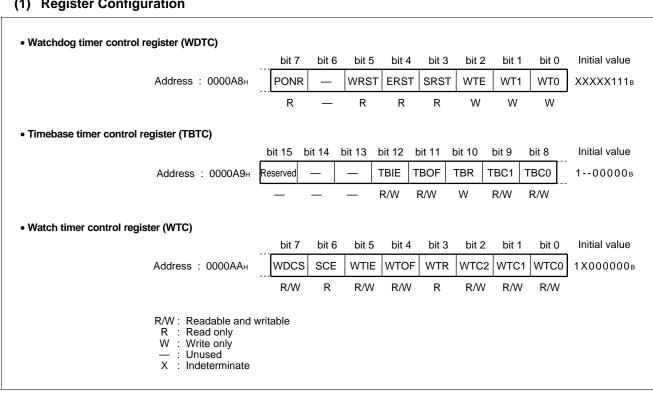

11. Watchdog Timer, Timebase Timer, and Watch Timer

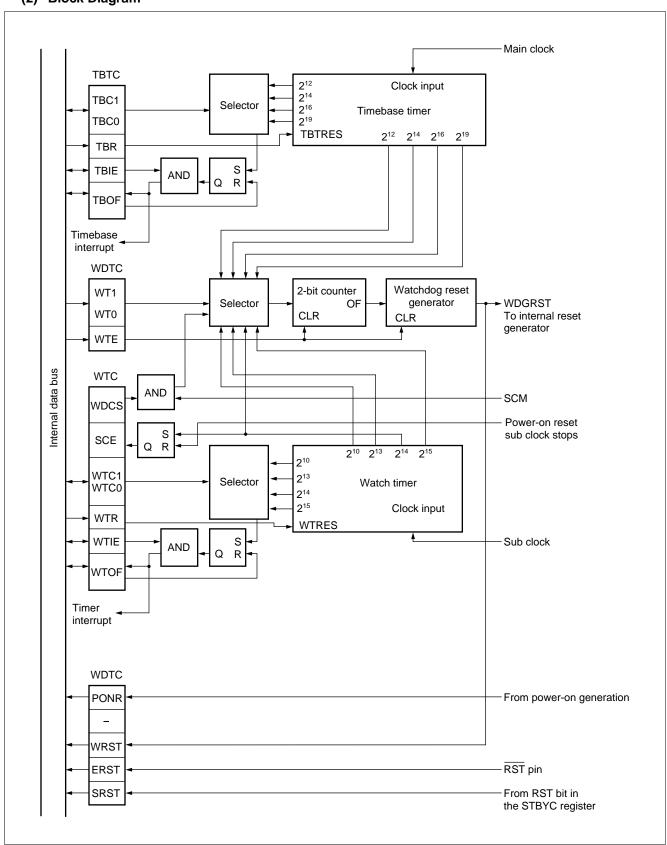

The watchdog timer consists of a 2-bit watchdog counter that uses the carry signal from the 18-bit timebase timer or the 15-bit watch timer as aclock source, a control register, and a watchdog reset controller.

The timebase timer consists of an 18-bit timer and a circuit that controls interval interrupts. Note that the timebase timer uses the main clock, regardless of the setting of the MCS bit and SCS bit in CKSCR.

The watch timer consists of a 15-bit timer and a circuit that controls interval interrupts. Note that the watch timer uses the sub clock, regardless of the setting of the MCS bit SCS bit in CKSCR.

(1) Register Configuration

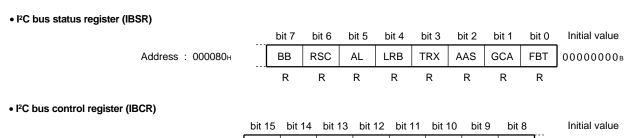

12. I²C Interface

The I²C interface is a serial I/O port that supports the Inter-IC bus and operates as a master/slave device on the I²C bus. This module has the following features:

- Master/slave transmission/reception
- · Arbitration function
- Clock synchronization function
- Slave address/general call address detection function
- Transfer direction detection function
- Start condition repeat generation and detection function
- Bus error detection function

13. External Bus Pin Control Circuit

The external bus pin control circuit controls the external bus pins required to extend the CPU's address/data bus outside the device.

(1) Register Configuration

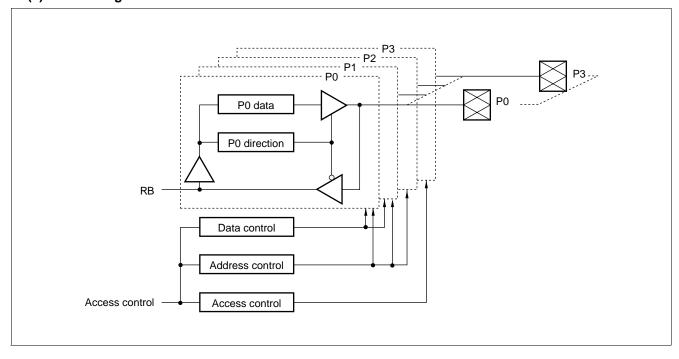

• External address output control register (HACR)

• Bus control signal selection register (ECSR)

W : Write onlyUnused"1" or "0"

14. Low-power Consumption Mode (CPU Intermittent Operation Function, Oscillation Stabilization Delay Time, Clock Multiplier Function)

The following are the operating modes: PLL clock mode, PLL sleep mode, PLL watch mode, pseudo-watch mode, main clock mode, main sleep mode, main watch mode, main stop mode, sub clock mode, sub sleep mode, sub watch mode, and sub stop mode. Aside from the PLL clock mode, all of the other operating modes are low-power consumption modes.

In main clock mode and main sleep mode, the main clock (main OSC oscillation clock) and the sub clock (sub OSC oscillation clock) operate. In these modes, the main clock divided by 2 is used as the operation clock, the sub clock (sub OSC oscillation clock) is used as the timer clock, and the PLL clock (VCO oscillation clock) is stopped.

In sub clock mode and sub sleep mode, only the sub clock operates. In these modes, the sub clock is used as the operation clock, and the main clock and PLL clock are stopped.

In PLL sleep mode and main sleep mode, only the CPU's operation clock is stopped; all clocks other than the CPU clock operate.

In pseudo-watch mode, only the watch timer and timebase timer operate.

In PLL watch mode, main watch mode, and sub watch mode, only the watch timer operates. In this mode, only the sub clock is used for operation, while the main clock and the PLL clock are stopped (the difference between the PLL watch mode, the main watch mode and the sub watch mode is that it resumes operation after an interrupt in the PLL clock mode, the main clock mode, and the sub clock mode respectively, and there is no reference concerning about clock mode operation).

The main stop mode, sub stop mode, and hardware standby mode stop oscillation, making it possible to retain data while consuming the least amount of power. (The difference between the main stop mode and the sub stop mode is that it resumes operation in the main clock mode and the sub clock mode respectively, and there is no reference concerning about stop mode operation).

The CPU intermittent operation function intermittently runs the clock supplied to the CPU when accessing registers, on-chip memory, on-chip resources, and the external bus. Processing is possible with lower power consumption by reducing the execution speed of the CPU while supplying a high-speed clock and using on-chip resources.

The PLL clock multiplier can be selected as either 2, 4, 6, or 8 by setting the CS1 and CS0 bits. These clocks are divided by 2 to be used as a machine clock.

The WS1 and WS0 bits can be used to set the main clock oscillation stabilization delay time for when stop mode is woken up.

(1) Register Configuration

- <3> SCS bit set
- <4> Main clock oscillation stabilization delay complete and MCS = 1
- <5> PLL clock and main clock synchronized timing and SCS = 0
- <6> Main clock ascillation stabilization delay complete and MCS = 0

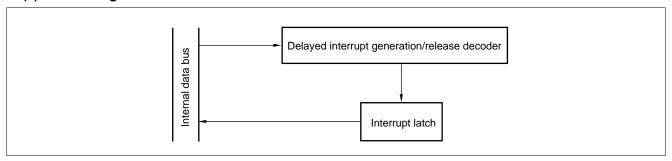

15. Delayed Interrupt Generation Module

The delayed interrupt generation module is used to generate the task switching interrupt. Interrupt requests to the F²MC-16L CPU can be generated and cleared by software using this module.

(1) Register Details

The DIRR register controls generation and clearing of delayed interrupt requests. Writing "1" to the register generates a delayed interrupt request. Writing "0" to the register clears the delayed interrupt request. The register is set to the interrupt cleared state by a reset. Either "0" or "1" can be written to the reserved bits. However, considering possible future extensions, it is recommended that the set bit and clear bit instructions are used for register access.

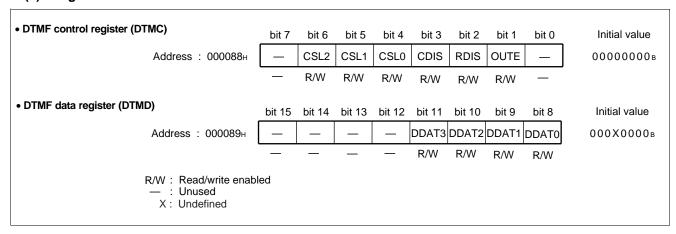

16. DTMF Generator

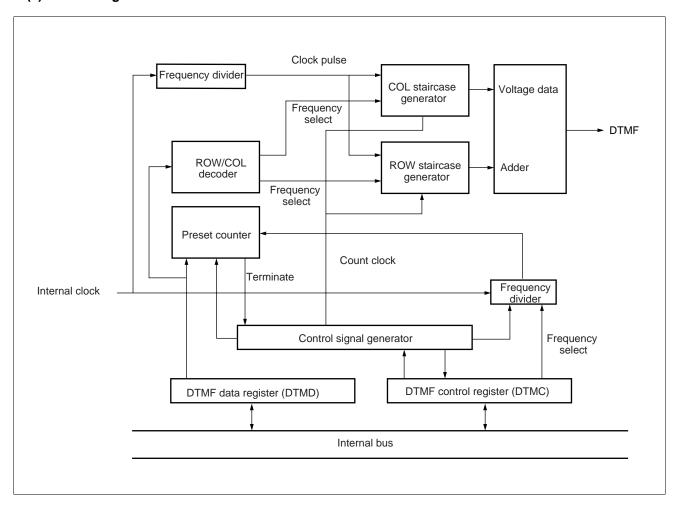

The DTMF (dual tone multifrequency) generator is a module that can generate a series of audio tones as heard from a push-button telephone or a radio transceiver with a keypad. It has the following features:

Capable of generating DTMF tones continuously (or even a single tone)

Capable of generating all CCITT tones: 0 to 9, *, #, A to D

^{*1:} AVcc, AVRH, AVRL and DVRH must not exceed Vcc (Vcc1 and Vcc2 are contained). Similarly, AVRL must not exceed AVRH.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

^{*2:} V₁ and V₀ must not exceed V_{CC} (V_{CC1} and V_{CC2} are contained) + 0.3 V.

^{*3:} Maximum output current specifies the peak value or one corresponding pin.

^{*4:} The average output current is the rating for the current from an individual pin averaged over 100 ms.

^{*5:} The average total output current is the rating for the current from all pins averaged over 100 ms.

^{*6:} Applies to the P47 and P70 to P72 on the MB90652A/653A/654A and MB90F654A.

Note: I2C must be used at above 2.7 V.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

3. DC Characteristics

(MB90652A/653A/654A: V_{CC} = 2.2 V to 3.6 V, V_{SS} = 0.0 V, T_{A} = -40°C to +85°C) (MB90P653A: V_{CC} = 2.7 V to 3.3 V, V_{SS} = 0.0 V, T_{A} = -40°C to +85°C) (MB92F654A: V_{CC} = 2.4 V to 3.6 V, V_{SS} = 0.0 V, T_{A} = -40°C to +85°C)

| operating clock frequency | | | _ | 1.5 | _ | 8 | MHz | MB90P653A |
| | f CPL | _ | _ | _ | 8.192 | _ | kHz | |
| Internal | t CP | _ | _ | 62.5 | _ | 666 | ns | |
| operating clock cycle time | t CPL | _ | _ | - | 122.1 | _ | μs | |
| Frequency fluctuation ratio | Δf | _ | _ | _ | _ | 5 | % | When locked *1 |

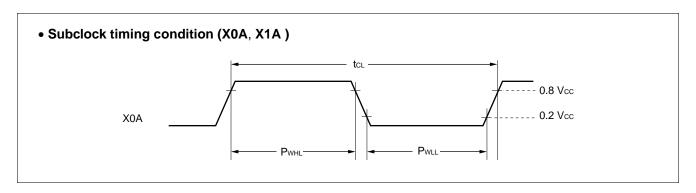

^{*1:} The frequency fluction ratio indicates the maximum fluctuation ratio from the set center frequency while locked when using the PLL multiplier.

Because the PLL frequency fluctuates around the set frequency with a certain cycle [approximately $CLK \times (1 CYC to 50 CYC)]$, the worst value is not maintained for long. (The pulse, if featured with the long period, would produce practically no error.)

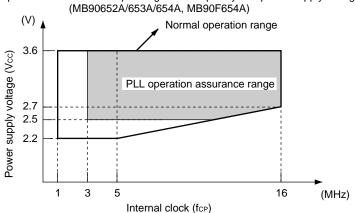

*2: The duty ratio should be in the range 30% to 70%.

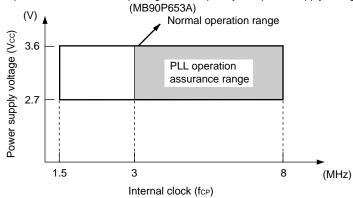

• PLL operation assurance range

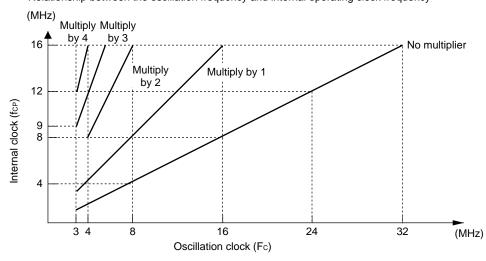

Relationship between the internal operating clock frequency and power supply voltage

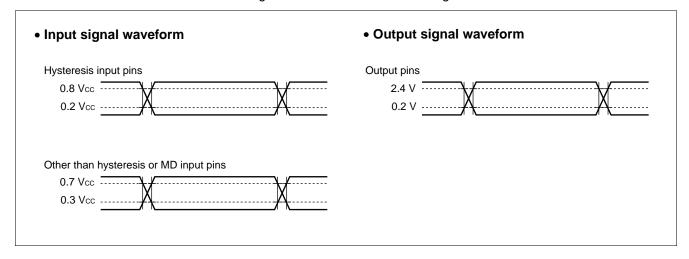

Relationship between the internal oprating clock frequency and power supply voltage

Relationship between the oscillation frequency and internal operating clock frequency

The AC characteristics are for the following measurement reference voltages.

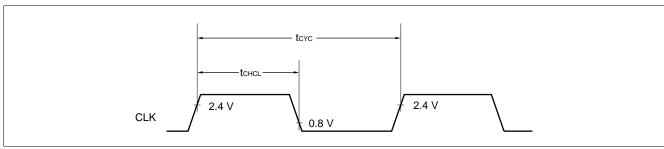

(2) Clock Output Timing

 $(Vcc = 2.7 \text{ V to } 3.3 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +85^{\circ}\text{C})$

| Parameter | Symbol , | Pin | Condition | Va | lue | Unit | Remarks | |

| Reference voltage | _ | AVRL | 0 | _ | AVRH – 2.7 | V | |
| Power supply | la | AVcc | _ | 3 | _ | mA | |
| current | I AH | AVcc | _ | _ | 5 ^{*3} | μΑ | |
| Reference voltage | IR | AVRH | _ | 200 | _ | μΑ | |
| supply current | IRH | AVRH | _ | _ | 5 ^{*3} | μΑ | |
| Variation between channels | _ | AN0 to AN7 | _ | _ | 4 | LSB | |

^{*1:} For a 16 MHz machine clock

Notes: • The error increases proportionally as |AVRH – AVRL| decreases.

• The output impedance of the external circuits connected to the analog inputs should be in the following range.

The output impedance of the external circuit should be less than approximately 7 k Ω .

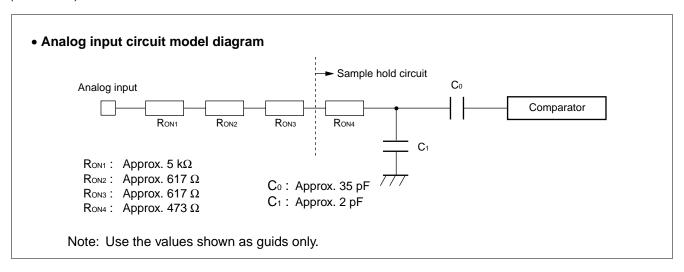

When using an external capacitor, it is recommended to have several thousand times the capacitance of the internal capacitor as a guid, if one takes into consideration the effect of the divided capacitance between the external capacitor and the internal capacitor.

- If the output impedance of the external circuit is too high, the sampling time might be insufficient (sampling time = 3.75 µs at a machine clock of 16 MHz).
- Vcc = Vcc1 = Vcc2

^{*2:} For an 8 MHz machine clock

^{*3:} The current when the A/D converter is not operating or the CPU is in stop mode (for Vcc = AVcc = AVRH = 3.0 V).

• OTPROM products

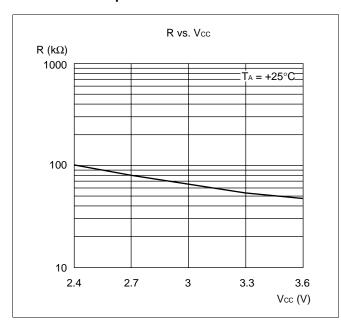

• FLAH products

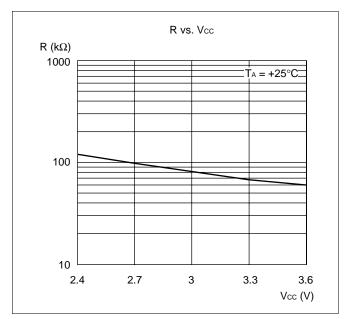

(6) Pull-up Resistance

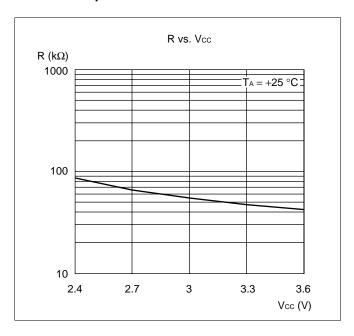

• Mask ROM products

• OTPROM products

• FLASH products

■ INSTRUCTIONS (340 INSTRUCTIONS)

Table 1 Explanation of Items in Tables of Instructions

| Item | Meaning |
|-----------|--|
| Mnemonic | Upper-case letters and symbols: Represented as they appear in assembler. Lower-case letters: Replaced when described in assembler. Numbers after lower-case letters: Indicate the bit width within the instruction. |
| # | Indicates the number of bytes. |
| ~ | Indicates the number of cycles. m: When branching n: When not branching See Table 4 for details about meanings of other letters in items. |
| RG | Indicates the number of accesses to the register during execution of the instruction. It is used calculate a correction value for intermittent operation of CPU. |
| В | Indicates the correction value for calculating the number of actual cycles during execution of the instruction. (Table 5) The number of actual cycles during execution of the instruction is the correction value summed with the value in the "~" column. |
| Operation | Indicates the operation of instruction. |
| LH | Indicates special operations involving the upper 8 bits of the lower 16 bits of the accumulator. Z: Transfers "0". X: Extends with a sign before transferring. -: Transfers nothing. |
| АН | Indicates special operations involving the upper 16 bits in the accumulator. * : Transfers from AL to AH. - : No transfer. Z : Transfers 00H to AH. X : Transfers 00H or FFH to AH by signing and extending AL. |
| I | Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky bit), |
| S | N (negative), Z (zero), V (overflow), and C (carry). * : Changes due to execution of instruction. |
| Т | - : No change. |
| N | S: Set by execution of instruction. R: Reset by execution of instruction. |
| Z | |
| V | |
| С | |
| RMW | Indicates whether the instruction is a read-modify-write instruction. (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory.) * : Instruction is a read-modify-write instruction. — : Instruction is not a read-modify-write instruction. Note: A read-modify-write instruction cannot be used on addresses that have different meanings depending on whether they are read or written. |

Table 2 Explanation of Symbols in Tables of Instructions

| Symbol | Meaning |
|---|---|
| A | 32-bit accumulator The bit length varies according to the instruction. Byte: Lower 8 bits of AL Word: 16 bits of AL Long: 32 bits of AL:AH |
| AH AL | Upper 16 bits of A Lower 16 bits of A |
| SP | Stack pointer (USP or SSP) |
| PC | Program counter |
| PCB | Program bank register |
| DTB | Data bank register |
| ADB | Additional data bank register |
| SSB | System stack bank register |
| USB | User stack bank register |
| SPB | Current stack bank register (SSB or USB) |
| DPR | Direct page register |
| brg1 | DTB, ADB, SSB, USB, DPR, PCB, SPB |
| brg2 | DTB, ADB, SSB, USB, DPR, SPB |
| Ri | R0, R1, R2, R3, R4, R5, R6, R7 |
| RWi | RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7 |
| RWj | RW0, RW1, RW2, RW3 |
| RLi | RL0, RL1, RL2, RL3 |
| dir | Compact direct addressing |
| addr16 addr24 ad24 0 to 15 ad24 16 to 23 | Direct addressing Physical direct addressing Bit 0 to bit 15 of addr24 Bit 16 to bit 23 of addr24 |
| io | I/O area (000000н to 0000FFн) |
| imm4 imm8 imm16 imm32 ext (imm8) | 4-bit immediate data 8-bit immediate data 16-bit immediate data 32-bit immediate data 16-bit data signed and extended from 8-bit immediate data |
| disp8 disp16 | 8-bit displacement 16-bit displacement |
| bp | Bit offset |
| vct4 vct8 | Vector number (0 to 15) Vector number (0 to 255) |
| ()b | Bit address |

(Continued)

| Symbol | Meaning |
|------------|---|
| rel | Branch specification relative to PC |
| ear eam | Effective addressing (codes 00 to 07) Effective addressing (codes 08 to 1F) |
| rlst | Register list |

Table 3 Effective Address Fields

| Code | Notation | | l | Address format | Number of bytes in address extension * | | | | |
|--|---|--|--|---|--|--|--|-------------------|---|
| 00 01 02 03 04 05 06 07 | R0 R1 R2 R3 R4 R5 R6 R7 | RW0 RW1 RW2 RW3 RW4 RW5 RW6 RW7 | RL0 (RL0) RL1 (RL1) RL2 (RL2) RL3 (RL3) | Register direct "ea" corresponds to byte, word, and long-word types, starting from the left | _ | | | | |
| 08 09 0A 0B | @RW0 @RW1 @RW2 @RW3 | | @RW1 @RW2 | | @RW1 @RW2 | | | Register indirect | 0 |
| 0C 0D 0E 0F | @RW0 + @RW1 + @RW2 + @RW3 + | | | Register indirect with post-increment | 0 | | | | |
| 10 11 12 13 14 15 16 17 | @RW0 + disp8 @RW1 + disp8 @RW2 + disp8 @RW3 + disp8 @RW4 + disp8 @RW5 + disp8 @RW5 + disp8 @RW6 + disp8 | | .p8 p8 p8 p8 p8 p8 p8 | Register indirect with 8-bit displacement | 1 | | | | |
| 18 19 1A 1B | @RW0 + disp16 @RW1 + disp16 @RW2 + disp16 @RW3 + disp16 | | @RW1 + disp16 displacement @RW2 + disp16 | | 2 | | | | |
| 1C 1D 1E 1F | @RW0 + RW7 @RW1 + RW7 @PC + disp16 addr16 | | V 7 | Register indirect with index Register indirect with index PC indirect with 16-bit displacement Direct address | 0 0 2 2 | | | | |

Note: The number of bytes in the address extension is indicated by the "+" symbol in the "#" (number of bytes) column in the tables of instructions.

Table 4 Number of Execution Cycles for Each Type of Addressing

| | | (a) | Number of register |
|----------|----------------------------|--|--------------------------------------|
| Code | Operand | Number of execution cycles for each type of addressing | accesses for each type of addressing |
| 00 to 07 | Ri RWi RLi | Listed in tables of instructions | Listed in tables of instructions |
| 08 to 0B | @RWj | 2 | 1 |
| 0C to 0F | @RWj + | 4 | 2 |
| 10 to 17 | @RWi + disp8 | 2 | 1 |
| 18 to 1B | @RWj + disp16 | 2 | 1 |
| 1C | @RW0 + RW7 | 4 | 2 |
| 1D 1E | @RW1 + RW7 @PC + disp16 | 4 | 2 |
| 1F | addr16 | 1 | 0 |

Note: "(a)" is used in the "~" (number of states) column and column B (correction value) in the tables of instructions.

Table 5 Correction Values for Number of Cycles Used to Calculate Number of Actual Cycles

| | (b) byte | | (c) v | word | (d) long | |
|---|------------------|------------------|------------------|------------------|------------------|------------------|
| Operand | Number of cycles | Number of access | Number of cycles | Number of access | Number of cycles | Number of access |
| Internal register | +0 | 1 | +0 | 1 | +0 | 2 |
| Internal memory even address Internal memory odd address | +0 +0 | 1 1 | +0 +2 | 1 2 | +0 +4 | 2 4 |
| Even address on external data bus (16 bits) Odd address on external data bus (16 bits) | +1 +1 | 1 1 | +1 +4 | 1 2 | +2 +8 | 2 4 |
| External data bus (8 bits) | +1 | 1 | +4 | 2 | +8 | 4 |

Notes: • "(b)", "(c)", and "(d)" are used in the "~" (number of states) column and column B (correction value) in the tables of instructions.

• When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

Table 6 Correction Values for Number of Cycles Used to Calculate Number of Program Fetch Cycles

| Instruction | Byte boundary | Word boundary |
|-----------------------------|---------------|---------------|
| Internal memory | _ | +2 |
| External data bus (16 bits) | _ | +3 |
| External data bus (8 bits) | +3 | _ |

Notes: • When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

• Because instruction execution is not slowed down by all program fetches in actuality, these correction values should be used for "worst case" calculations.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
