# 16-bit Proprietary Microcontroller

**CMOS** 

# F<sup>2</sup>MC-16L MB90660A Series

## MB90662A/663A/P663A

#### ■ DESCRIPTION

MB90660A series microcontrollers are 16-bit microcontrollers optimized for high speed realtime processing of consumer equipment and system control of air conditioner video cameras, VCRs, and copiers. Based on the F2MC\*-16 CPU core, an F2MC-16L is used as the CPU. This CPU includes high-level language-support instructions and robust task switching instructions, and additional addressing modes.

Microcontrollers in this series have built-in peripheral resources including multi-function timers, 16-bit reload timer four channels, 8-bit PWM one channel, UART one channel, 10-bit A/D eight converter channels, and external interrupt eight channels.

\*: F2MC stands for FUJITSU Flexible Microcontroller.

#### **■ FEATURES**

- F<sup>2</sup>MC-16L CPU
- Minimum execution time: 62.5 ns/4 MHz oscillation (uses PLL multiplier): fastest speed at quadruple operation
- Instruction set optimized for controller applications

Upward compatibility at object level with the F<sup>2</sup>MC-16(H)

Various data types (bit, byte, word, long-word)

Higher speed due to review of instruction cycle

Expanded addressing modes: 23 types

High coding efficiency

Two access methods (bank system or linear pointer)

Improved multiply-and-divide instructions (additional signed instructions)

Improved high-precision operation with 32-bit accumulator

Extended intelligent I/O services (access area extended by 64 Kbytes)

Large memory space: 16 Mbytes DZSC.COM

(Continued)

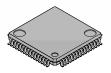

#### PACKAGE

64-pin Plastic SH-DIP

(DIP-64P-M01)

64-pin Plastic LQFP

(FPT-64P-M09)

#### (Continued)

• Improved instruction set applicable to high-level language (C) and multitasking

System stack pointer

Improved indirect instructions using various pointers

Barrel shift instruction

Stack check function

- Improved execution speed: 4-byte instruction queue
- Improved interrupt functions
- Automatic data transfer function independent of CPU

#### Peripheral Resources

• ROM: 16 Kbytes (MB90661A)

32 Kbytes (MB90662A)

48 Kbytes (MB90663A)

One-time PROM: 48 Kbytes (MB90P663A)

• RAM: 512 bytes (MB90661A)

1.64 Kbytes (MB90662A)

2 Kbytes (MB90663A/MB90P663A)

- General-purpose ports: Max. 51
- UART: 1 channel

Can be used for both asynchronous transfer and clocked serial (I/O extended serial) communications

• A/D converter: 10-bit, 8 channels

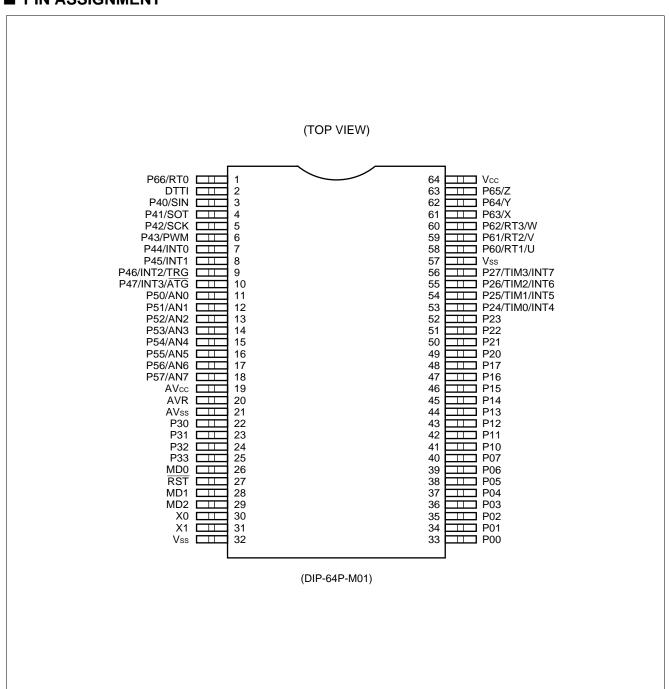

Includes 8-bit conversion mode

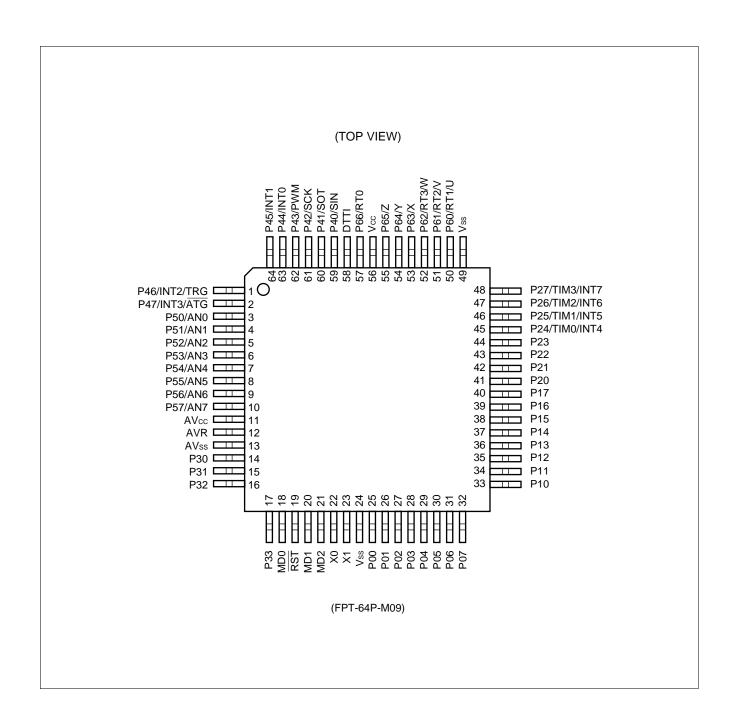

- 16-bit reload timer: 4 channels
- 8-bit PWM: 1 channel
- External interrupts: 8 channels
- 18-bit timebase timer with watchdog timer function
- PLL clock multiplier function
- CPU intermittent operation function
- Various standby modes
- Package: SH-DIP-64/LQFP-64 (0.65-mm pitch)
- CMOS technology

Miscellaneous Items	V <sub>PP</sub> is shared with MD2 terminal (when writing the EPROM)	_	_			

#### **■ PIN ASSIGNMENT**

### **■ PIN DESCRIPTION**

Pin	no.	D'	Circuit	F
SH-DIP*1	LQFP*2	Pin name	type	Function
30	22	X0	Α	Crystal oscillator pin (32 MHz).
31	23	X1	(Oscillator)	
33 to 40	25 to 32	P00 to P07	B (CMOS)	General-purpose I/O ports.
41 to 48	33 to 40	P10 to P17	B (CMOS)	General-purpose I/O ports.
49 to 52	41 to 44	P20 to P23	B (CMOS)	General-purpose I/O ports.
53 to 56	45 to 48	P24 to P27	G (CMOS)	General-purpose I/O ports. This function is activated when the output specification of the reload timer is "disabled".
		TIM0 to TIM3		I/O pins for reload timers 0 to 4. Input is used only as necessary while serving as input for the reload timer. It is therefore necessary to stop output beforehand using other functions unless intentionally used otherwise.  Their function as output terminals for the reload timer is activated when the output specification is "enabled".
		INT4 to INT7		External interrupt request input pins. Input is used only as necessary while external interrupts are enabled. It is therefore necessary to stop output beforehand using other functions unless intentionally used otherwise.
22 to 25	14 to 17	P30 to P33	B (CMOS)	General-purpose I/O ports.
3	59	P40	E (CMOS/H)	General-purpose I/O port. This function is always enabled.
		SIN		UART serial data input pin. Input is used only as necessary while serving as UART input. It is therefore necessary to stop output beforehand using other functions unless intentionally used otherwise.
4	60	P41	E (CMOS/H)	General-purpose I/O port. This function is activated when the serial data output specification of the UART is "disabled".
		SOT		UART serial data output pin. This function is activated when the serial data output specification of the UART is "enabled".

\*1: DIP-64P-M01 (Continued)

\*2: FPT-64P-M09

Pin	no.		Circuit	
SH-DIP*1	LQFP*2	Pin name	type	Function
5	61	P42	E (CMOS/H)	General-purpose I/O port. This function is activated when the clock output specification of the UART is "disabled".
		SCK		UART clock I/O pin. This function is activated when the clock output specification of the UART is "enabled". Input is used only as necessary while serving as UART input. It is therefore necessary to stop output beforehand using other functions unless intentionally used otherwise.
6	62	P43	E (CMOS/H)	General-purpose I/O port. This function is activated when the output specification of the PWM is "disabled".
		PWM		PWM timer output pin. This function is activated when the waveform output specification of the PWM timer is "enabled".
7 8	63 64	P44 to P45	D (CMOS/H)	General-purpose I/O ports. This function is always active.
		INT0 to INT1		External interrupt request input pins. Input is used only as necessary while external interrupts are enabled.
9	1	P46	D (CMOS/H)	General-purpose input port. This function is always active.
		INT2		External interrupt request input pin. Input is used only as necessary while external interrupts are enabled.
		TRG		Timer clear trigger input pin for multi-function timer. Input is used only as necessary while multi-function timer input is enabled.
10	2	P47	D (CMOS/H)	General-purpose input port. This function is always active.
		INT3		External interrupt request input pin. Input is used only as necessary while external interrupts are enabled.
		ĀTG		Trigger input pin for the A/D converter. Input is used only as necessary while the A/D converter is performing input.
11 to 18	3 to 10	P50 to P57	C (AD)	Open-drain type I/O ports. This function is enabled when the analog input enable register specification is "port".
		AN0 to AN7		Analog input pins for the A/D converter. This function is enabled when the analog input enable register specification is "AD".

\*1: DIP-64P-M01

\*2: FPT-64P-M09

Pin	no.	D:	Circuit	Function		
SH-DIP*1	LQFP*2	Pin name	type	Function		
58 50		P60	E (CMOS/H)	General-purpose I/O port. This function is enabled when the multi-function timer waveform output specification is "disabled" and the 3-phase waveform output specification is "disabled".		
		RT1		Multi-function timer waveform output pin. This function is enabled when the multi-function timer output specification is "enabled".		
		U		3-phase waveform output pin. This function is enabled when the 3-phase waveform output specification is "enabled".		
59	51	P61	E (CMOS/H)	General-purpose I/O port. This function is enabled when the multi-function timer waveform output specification is "disabled" and the 3-phase waveform output specification is "disabled".		
		RT2	-	Multi-function timer waveform output pin. This function is enabled when the multi-function timer output specification is "enabled".		
		V		3-phase waveform output pin. This function is enabled when the 3-phase waveform output specification is "enabled".		
60	52	P62	E (CMOS/H)	General-purpose I/O port. This function is enabled when the multi-function timer waveform output specification is "disabled" and the 3-phase waveform output specification is "disabled".		
		RT3		Multi-function timer waveform output pin. This function is enabled when the multi-function timer output specification is "enabled".		
		W		3-phase waveform output pin. This function is enabled when the 3-phase waveform output specification is "enabled".		
61	53	P63	E (CMOS/H)	General-purpose I/O port. This function is enabled when the 3-phase waveform output specification is "disabled".		
		Х		3-phase waveform output pin. This function is enabled when the 3-phase waveform output specification is "enabled".		
62	54	P64	E (CMOS/H)	General-purpose I/O port. This function is enabled when the 3-phase waveform output specification is "disabled".		
		Υ		3-phase waveform output pin. This function is enabled when the 3-phase waveform output specification is "enabled".		

\*1: DIP-64P-M01

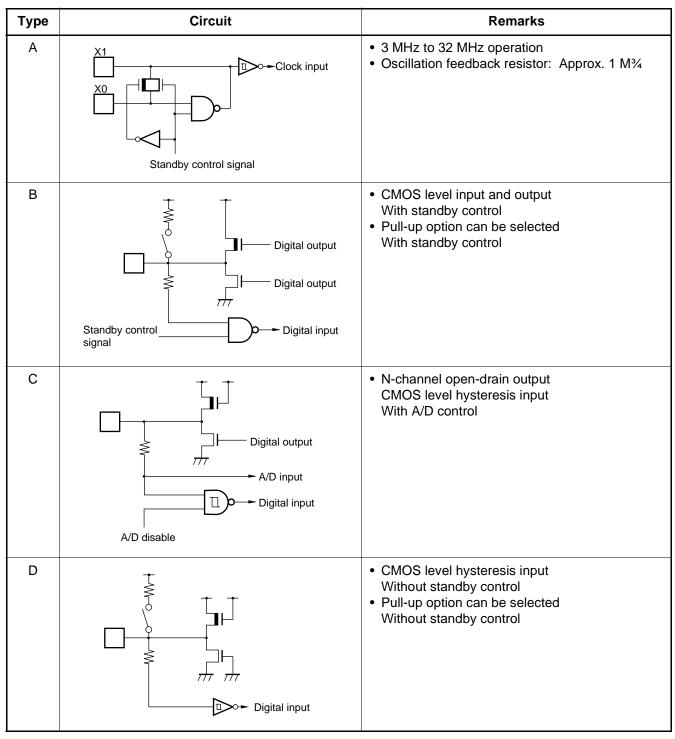

\*2: FPT-64P-M09

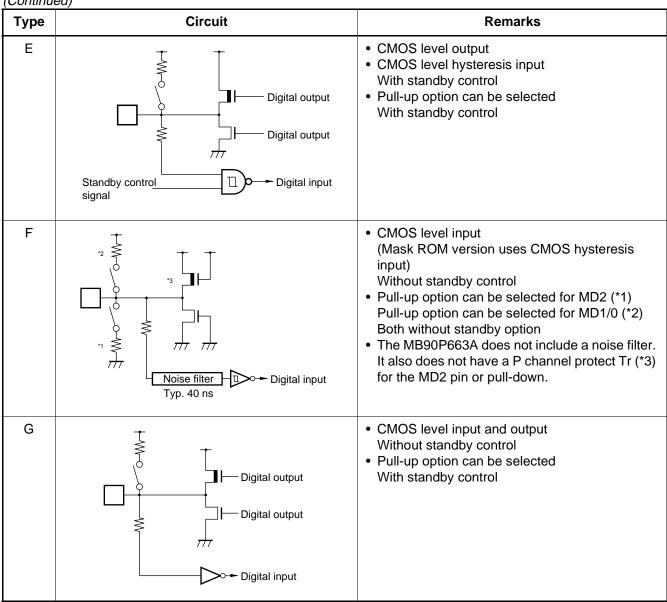

### (Continued)

Pin	no.		Circuit	
SH-DIP*1	LQFP*2	Pin name	type	Function
63	55	P65	E (CMOS/H)	General-purpose I/O port. This function is enabled when the 3-phase waveform output specification is "disabled".
		Z		3-phase waveform output pin. This function is enabled when the 3-phase waveform output specification is "enabled".
1	57	P66	E (CMOS/H)	General-purpose I/O port. This function is enabled when the multi-function timer waveform output specification is "disabled".
		RT0		Multi-function timer waveform output pin. This function is enabled when the multi-function timer output specification is "enabled".
2	58	DTTI	D (CMOS/H)	3-phase waveform output disable input (DTTI) pin.
19	11	AVcc	Power supply	Power supply for analog circuits. Turn this power supply on/off by applying a voltage level greater than AVcc to Vcc.
20	12	AVR	Power supply	Reference power supply for analog circuits. Turn this pin on/off by applying a voltage level greater than AVR to AVcc.
21	13	AVss	Power supply	Ground level for analog circuits.
26 28 29	18 20 21	MD0 to MD2	F (CMOS/H)	Input pins for specifying operation mode. Use these pins by directly connecting to Vcc or Vss.
27	19	RST	D (CMOS/H)	External reset request input pin.
64	56	Vcc	Power supply	Power supply for digital circuits.
32 57	24 49	Vss	Power supply	Ground level for digital circuits.

\*1: DIP-64P-M01 \*2: FPT-64P-M09

#### **■ I/O CIRCUIT TYPE**

#### **■ HANDLING DEVICES**

#### 1. Preventing Latchup

Latchup may occur with CMOS ICs if voltage higher than Vcc or lower than Vss is applied to input and output pins other than medium- to high-voltage pins or if higher than the voltage which shows on "1. Absolute Maximum Ratings" in section "■ Electrical Characteristics" is applied between Vcc and Vss.

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

To prevent the similar aftereffects, use also the utmost care not to allow the analog supply voltage to exceed the digital supply voltage.

#### 2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be pins should be connected to a pull-up or pull-down resistor.

#### 3. External Reset Input

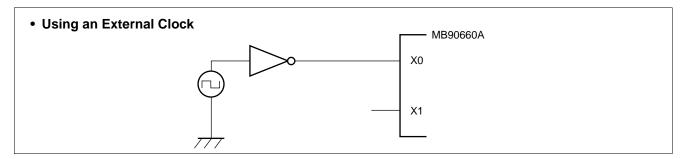

When resetting by inputting "L" level to the  $\overline{RST}$  pin, the "L" level must be input for at least 5 machine cycles to ensure that internal reset has occurred. Be aware of this point when using external clock input.

#### 4. Vcc, Vss Pin

Be sure that both Vcc and Vss are at the same voltage.

#### 5. Notes on Using an External Clock

Drive X0 when using an external clock.

#### 6. Order of Power-on to A/D Converter and Analog Inputs

Power-off (AVcc, AVR) to the digital power supply (Vcc) must be performed only after the A/D converter and the analog inputs (AN0 to AN7) has been turned on.

Turning on or off should always be performed keeping AVR below AVcc.

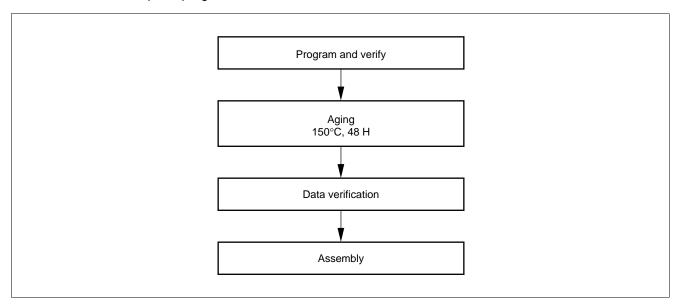

Use caution for the input voltage not to exceed AVcc when the pin sharing the analog input for its function is used as an input port.

#### 7. Programming Mode

When the MB90P663A is shipped from Fujitsu, all bits ( $48 \text{ K} \times 8 \text{ bits}$ ) are set to "1". Program by setting selected bits to "0" when you wish to set the data. Note that "1" cannot be programming electrically.

#### 8. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked OTPROM microcomputer program.

#### 9. Programming Yields

All bits cannot be programmed at Fujitsu shipping test to a blanked OTPROM microcomputer, due to its nature. For this reason, a programming yield of 100% cannot be assured at all times.

#### 10.Fluctuations in Supply Voltage

Although the assured  $V_{\rm CC}$  supply voltage operating range is as specified, sudden fluctuations even within this range may cause a malfunction. Therefore, the voltage supply to the IC should be kept as constant as possible. The  $V_{\rm CC}$  ripple (P-P value) at the supply frequency (50 to 60 Hz) should be less than 10% of the typical  $V_{\rm CC}$  value, or the coefficient of excessive variation should not be more than 0.1 V/ms instantaneous change when power is supplied.

#### ■ PROGRAMMING THE MB90P663A EPROM

Since the MB90P663A is functionally equivalent to the MBM27C1000 when it is in EPROM mode, it is possible to program them with a general-purpose EPROM programmer by using a special adaptor socket.

However, the MB90660A does not support the electronic signature (device ID code) mode.

### 1. Pin Assignment in EPROM Mode

#### 3. Programming Data

- (1) Adjust the EPROM programmer to settings for the MBM27C1000.
- (2) Load program data from addresses 10000H to 1FFFFH in the EPROM programmer.

OTPROM addresses FF4000<sub>H</sub> to FFFFFF<sub>H</sub> of the MB90P663A in operation mode correspond to addresses 14000<sub>H</sub> to 1FFFF<sub>H</sub> in EPROM mode.

- (3) Set the MB90P663A into the adaptor socket and install the adaptor socket into the EPROM programmer. Pay attention to the orientation of the device and the adaptor socket at this time.
- (4) Programming data to the EPROM.
- (5) If data cannot be programmed, try again with a 0.1  $\mu$ F capacitor connected between Vcc and GND and VPP and GND.

Note: Since Mask ROM products (MB90662A/663A) do not include an EPROM mode, data cannot be read-out using an EPROM programmer.

#### 4. PROM Option Bitmap

The programming method is the same as a PROM, and can be set by programming values to addresses indicated in the memory map.

The following bit map shows the relation between bits and options.

#### • PROM Option Bitmap

Bit Address	7	6	5	4	3	2	1	0
00004н	P07	P06	P05	P04	P03	P02	P01	P00
	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up
	1: No	1: No	1: No					
	0: Yes	0: Yes	0: Yes					
00008H	P17	P16	P15	P14	P13	P12	P11	P10
	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up
	1: No	1: No	1: No					
	0: Yes	0: Yes	0: Yes					
0000CH	P27	P26	P25	P24	P23	P22	P21	P20
	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up
	1: No	1: No	1: No					
	0: Yes	0: Yes	0: Yes					
00010H	P43	P42	P41	P40	P33	P32	P31	P30
	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up
	1: No	1: No	1: No					
	0: Yes	0: Yes	0: Yes					
00014H *1	P47 Pull-up 1: No 0: Yes	P46 Pull-up 1: No 0: Yes	P45 Pull-up 1: No 0: Yes	P44 Pull-up 1: No 0: Yes	RST Pull-up 1: No 0: Yes	DTTI Pull-up 1: No 0: Yes	Accept asynchronous reset 1: Yes 0: No	MD1/MD0*2 Pull-up 1: No 0: Yes
00018H	Open	P66 Pull-up 1: No 0: Yes	P65 Pull-up 1: No 0: Yes	P64 Pull-up 1: No 0: Yes	P63 Pull-up 1: No 0: Yes	P62 Pull-up 1: No 0: Yes	P61 Pull-up 1: No 0: Yes	P60 Pull-up 1: No 0: Yes

Initially (value when blank), all bits are "1".

- \*1: Under this release, the pull-up resistor is cut-off during stop mode for pins for which the pull-up option was selected. (Pins for which the circuit type shown in the "■ Pin Description" is B or E.)

  However, the pull-up resistor is not cut-off even in stop mode for P44 to 47, RST, DTTI (pins for which the circuit type shown in the "■ Pin Description" is D or G), and MD1 and MD0.
- \*2: Whether or not a pull-up/pull-down resistor is present for MD2, MD1 and MD0 is determined as follows. If pull-up/pull-down resistor is selected, it is included with all 2 (or 3) pins. Presence or absence of the pull-up or pull-down resistors for the mode terminal cannot be selected for each pin.

Pin	MB90P663A	MB90663A/2A
MD2	No	Pull-down can be selected
MD1	With pull-up resistor	With pull-up resistor
MD0	With pull-up resistor	With pull-up resistor

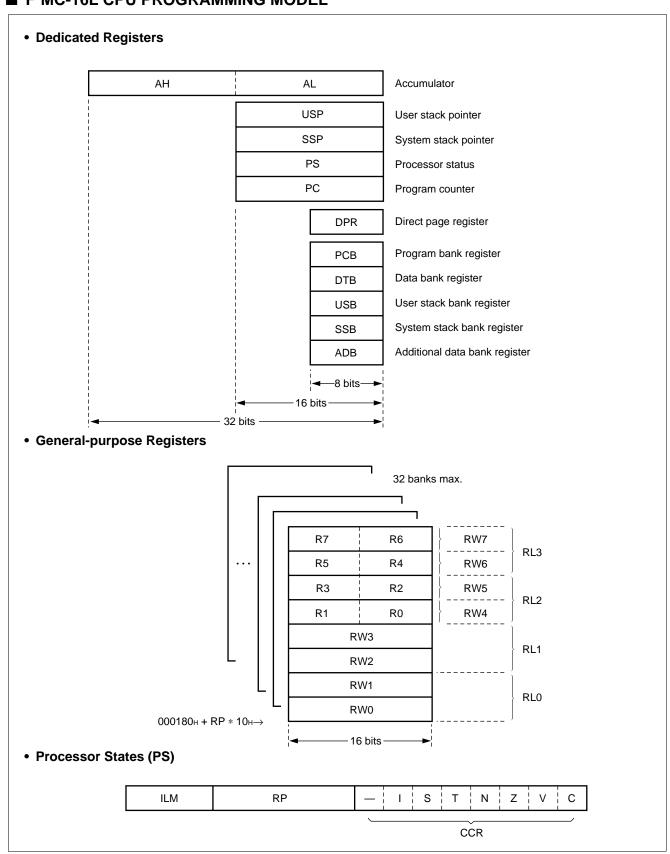

Notes: • "FFH" must be set to addresses no defined in the table above.

• Since the option setting for the MB90P663A takes 8 machine cycles, the option setting is not made until a clock is provided after power-on. (This results in no pull-up for all pins, and asynchronous reset input is accepted.)

<sup>\*1:</sup> Access prohibited

- \*2: Registers marked "R/W!" in the access column include some bits that can only be read or only be written. For details, see the register list for each resource.
- \*: When a register marked "R/W!", "R/W\*" or "W" in the access column is accessed by a read-modify-write instruction (such as a bit set instruction), the bit operated on by the instruction will be set to the specified value, but a malfunction will occur if there are any other bits which can only be written. Therefore, do not access these locations using these instructions.

#### **Description of Initial Values**

- 0: The initial value of this bit is "0".
- 1: The initial value of this bit is "1".
- \*: The initial value of this bit is "1" or "0". (This is determined depending on the level of the MD0 to MD2 pins.)
- X: The initial value of this bit is undefined.
- -: This bit is not used. The initial value is undefined.
- Note: The initial value results for bits which can only be written when initialized by a reset. Note that this is not the value when read.
  - Also, sometimes LPMCR, CKSCR and WDTC are initialized and sometimes they are not depending on the type of reset. If they are initialized, the initial value is used.

Note: Do not specify I<sup>2</sup>OS activation in interrupt control registers that do not support I<sup>2</sup>OS.

①: indicates that the interrupt request flag is cleared by the I2OS interrupt clear signal (with stop request).

<sup>×:</sup> indicates that the interrupt request flag is not cleared by the I<sup>2</sup>OS interrupt clear signal.

#### **■ PERIPHERAL RESOURCES**

#### 1. Parallel Port

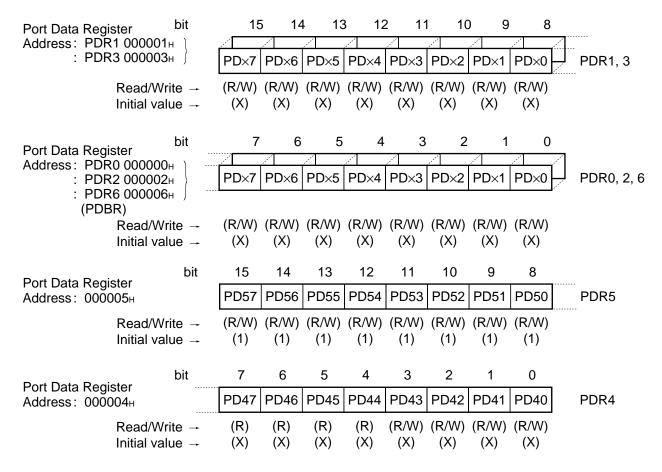

The MB90660A includes 39 I/O pins, 4 input pins, and 8 open-drain output pins.

Port 0, 1, 2, 3 and 6 are I/O ports. They are used for input when the corresponding direction register value is "0", and for output when the value is "1".

Port 5 is an open-drain port. It is used as a port when the analog input enable register is "0".

Ports 40 to 43 are I/O ports. They are used for input when the corresponding direction register value is "0", and for output when the value is "1". Ports 44 to 47 are input ports which can only be used for reading data.

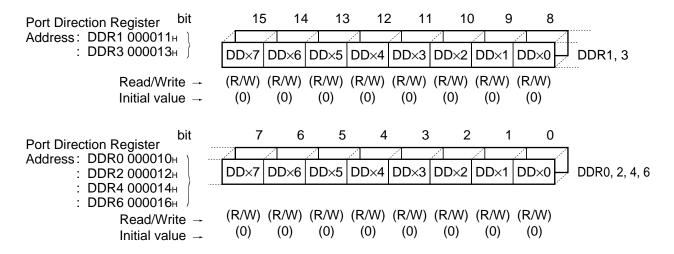

#### (1) Register Configuration

Notes: There are no register bits for bits 15 to 12 of Port 3.

There is no register bit for bit 7 of Port 6.

Bits 7 to 4 of Port 4 can only be used to read data.

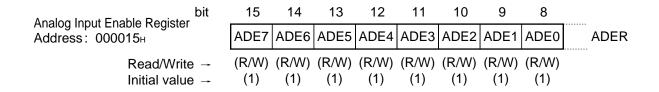

Notes: There are no register bits for bits 15 to 12 of Port 3.

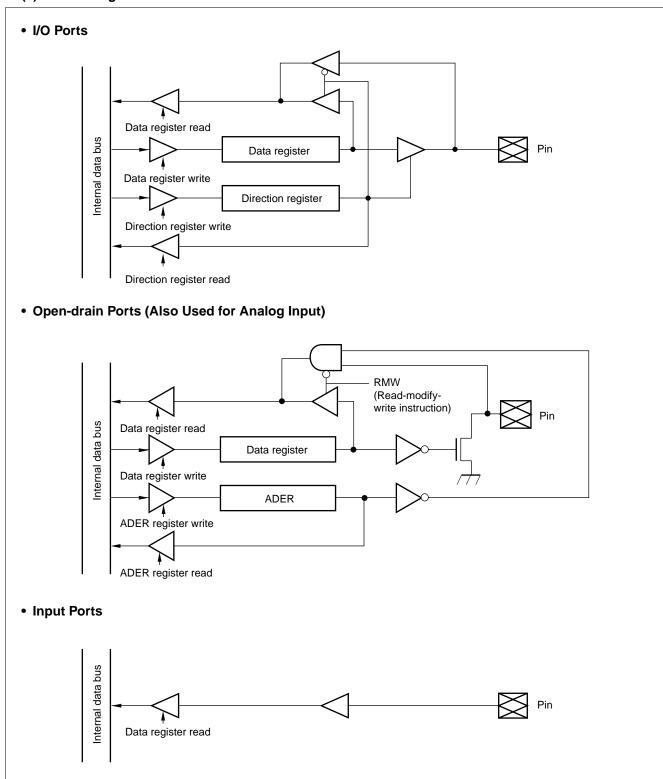

There are not register bits for bits 7 to 4 of Port 4

There is no DDR for Port 5.

There is no register bit for bit 7 of Port 6.

### (2) Block Diagrams

#### 2. Multi-function Timer

The multi-function timer controls up to 7 realtime output pins, and includes the following functions.

- Interval timer function
   It can output pulses or generate an interrupt at a fixed interval.
- PWM output function

Can perform output for a fixed cycle pulse while changing the duty ratio (ratio between "L" output width and "H" output width) in realtime.

3-phase AC sine wave output (inverter control output) function
 Can perform 3-phase AC sine wave output using AC motor inverter control, etc. (using any setting for the non-overlap interval)

This timer also has the following characteristics.

• Pulse cycle control using 14-bit timer

A machine cycle of 1, 2, 8 or 16 can be selected based on pre-scalars as the clock source (Minimum resolution of 62.5 ns at 16 MHz operation).

Can use a carrier frequency up to 30 KHz at 8-bit stop when used for AC motor control.

Up count only or up/down count can be selected using the count mode selection.

Possessing a buffer, cycle can be changed in realtime by transferring data from buffer upon zero detect.

· Duty control using compare registers

Possessing four compare registers, output pulse duty can be set for four separate channels.

Each possessing a separate buffer, duty can be changed in realtime by transferring data from buffer upon zero detect or comparison.

Non-overlap control using dead time timer

Dead time timer can be used to generate PWM output for three channels or even reversed signals with non-overlap, thus allowing an AC motor control wave (U, V, W, X, Y, Z) to be generated.

A machine cycle of 1, 4, 8 or 32 can be selected based on pre-scalars as the clock source for the dead timer (Minimum resolution of 62.5 ns at 16 MHz operation)

Forced stop control using DTTI pin input

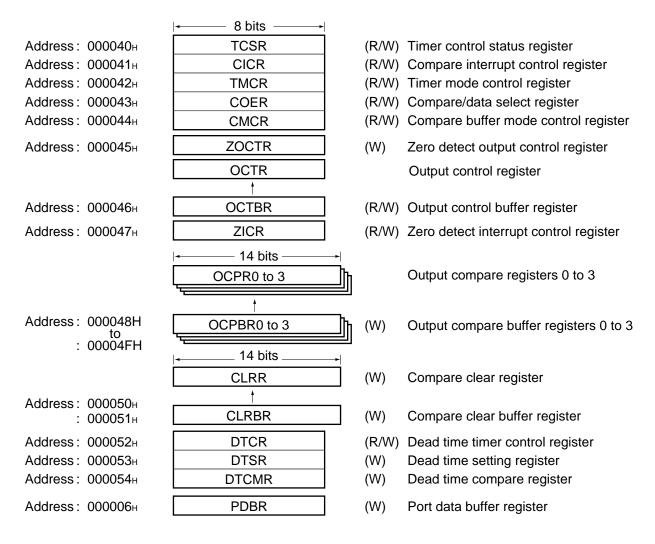

The forced pin output level can be fixed by DTTI pin input or software.

Inactive control can be performed during AC motor control using DTTI pin input.

External pin control even during vibration stop can be performed through clockless DTTI pin input.

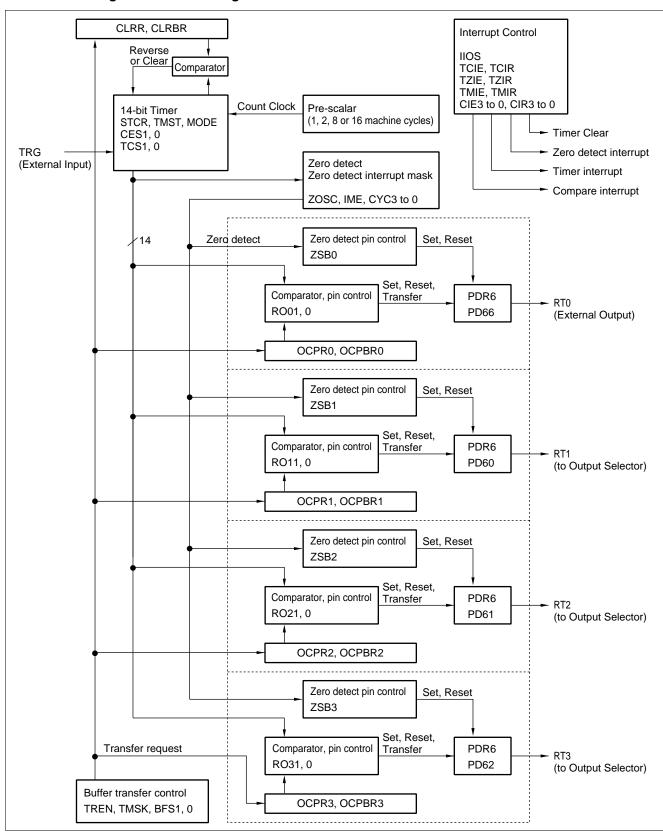

• Event detection and interrupt generation using various flags
Flags can be set and/or interrupts generated upon zero detect, overflow, detect of match with compare registers,
or clear by TRG pin input, or any match of the compare registers for the four channels for the 14-bit timer (also
possible to disable interrupt output).

#### (1) Register Configuration

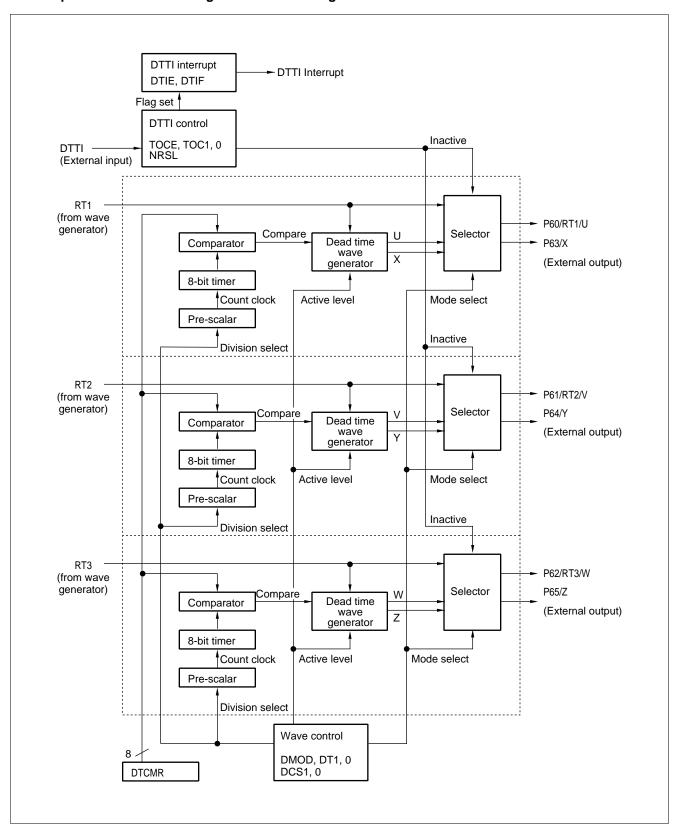

#### (2) Block Diagrams

• Timer/wave generator block diagram

• Output selector/dead time generator block diagram

#### 3. UART

The UART is a serial I/O port for asynchronous (start/stop) or CLK synchronous communications with external resources. It has the following characteristics:

- Full duplex double buffering
- Asynchronous (start/stop) or CLK synchronous communications
- Multiprocessor mode support
- Internal dedicated baud-rate generator

Asynchronous : 19230/9615/31250/4808/2404/1202 bps

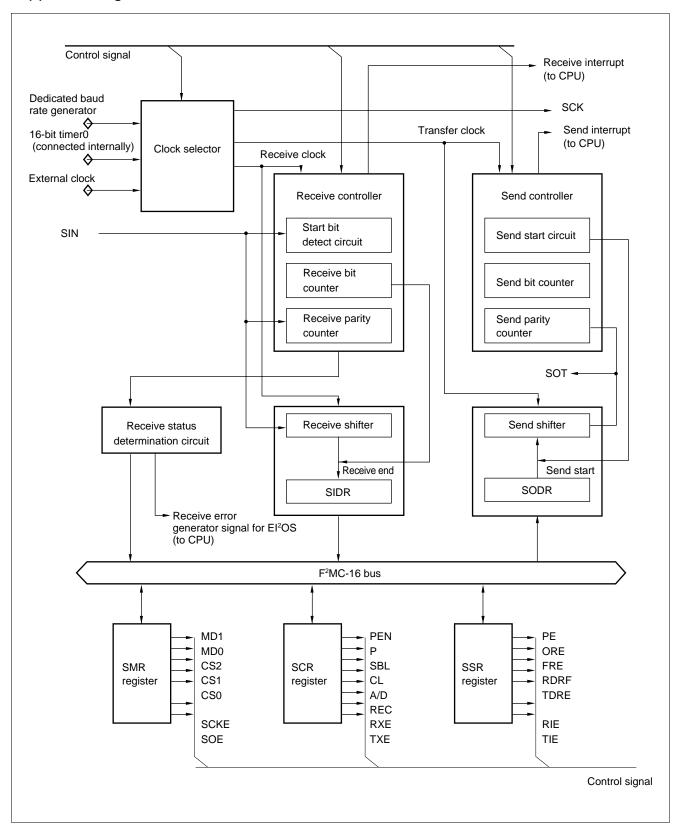

CLK synchronous : 2 M/1 M/500 K/250 K bps
• Free baud-rate setting based on external clock

- Error detection functions (parity, framing and overrun)
- Use of NRZ coded transfer signal
- Supports intelligent I/O services

#### (2) Block Diagram

#### 4. 10-bit, 8-channel A/D Converter (with 8-bit Resolution Mode)

This 10-bit, 8-channel A/D converter is used to convert analog input voltage to corresponding digital values. It has the following features.

- Conversion time: 6.13 μs per channel (includes sample and hold time at 98 machine cycles/machine clock of 16 MHz)
- Sample hold time: 3.75 μs per channel (60 machine cycles per machine clock of 16 MHz)
- RC-type sequential approximation conversion with sample and hold circuits
- 10-bit or 8-bit resolution
- Analog input can be selected from 8 channels

Single conversion mode : One channel selected for conversion

Scan conversion mode : Consecutive multiple channels converted (programmable with max. eight

channels)

Repetitive conversion mode: Data on the specified channel is converted repeatedly

Stop conversion mode : Once one channel is converted, operations stop and the device waits until

started again (conversion start can be synchronized)

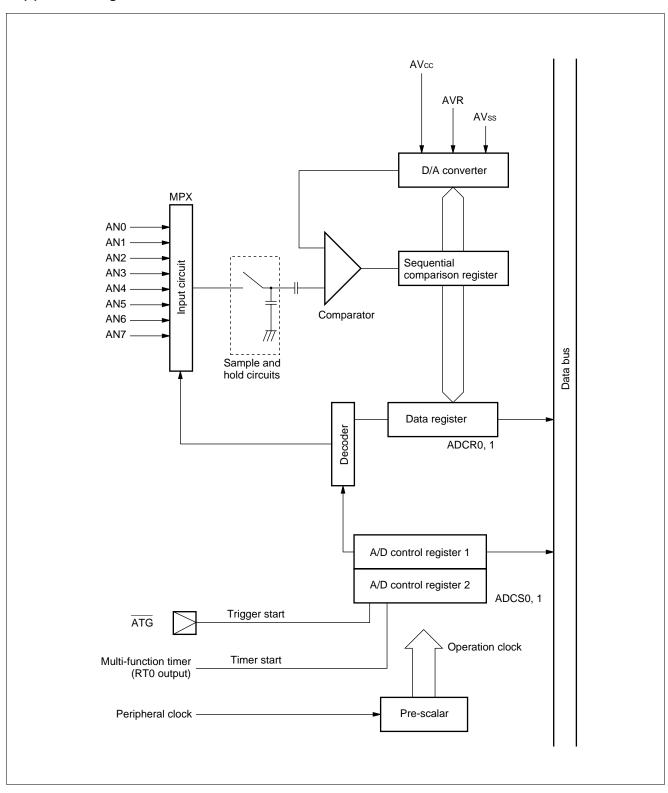

At the end of each A/D conversion, an interrupt request to the CPU can be generated. This interrupt can be
used to activate I<sup>2</sup>OS or transfer A/D conversion results to memory, making it useful when continuous
processing is desired.

• Conversion can be triggered by software, an external trigger (falling edge), and/or a timer (rising edge).

### (2) Block Diagram

#### 5. PWM Timer

This block, which is an 8-bit reload timer module, outputs the pulse width modulation (PWM) using pulse output control corresponding to the timer operation.

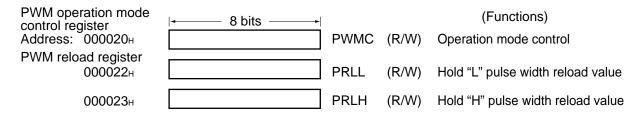

In terms of hardware, this block possesses an 8-bit down counter, two 8-bit reload registers for setting "L" width and "H" width, a control register, external pulse output pin, and interrupt output circuit to achieve the following functions.

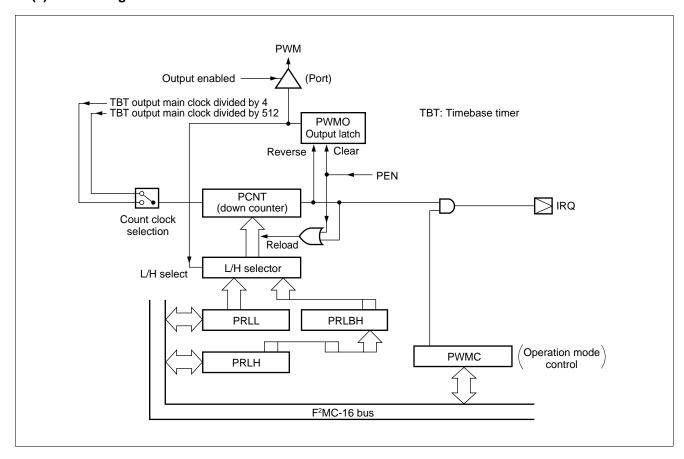

• PWM output operation : Pulse waves of any period and duty factor are output.

This block can also be used as a D/A converter with an external circuit.

Interrupt requests can be output based on counter underflow.

#### (1) Register Configuration

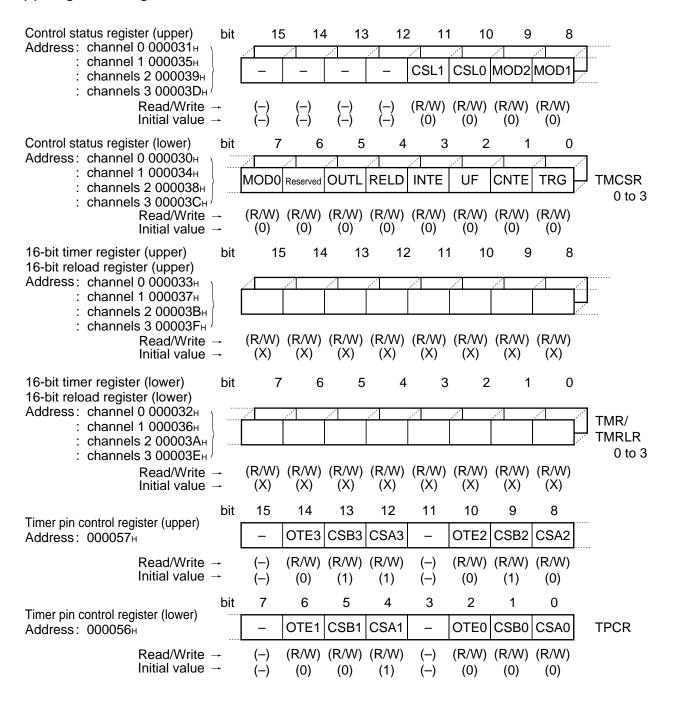

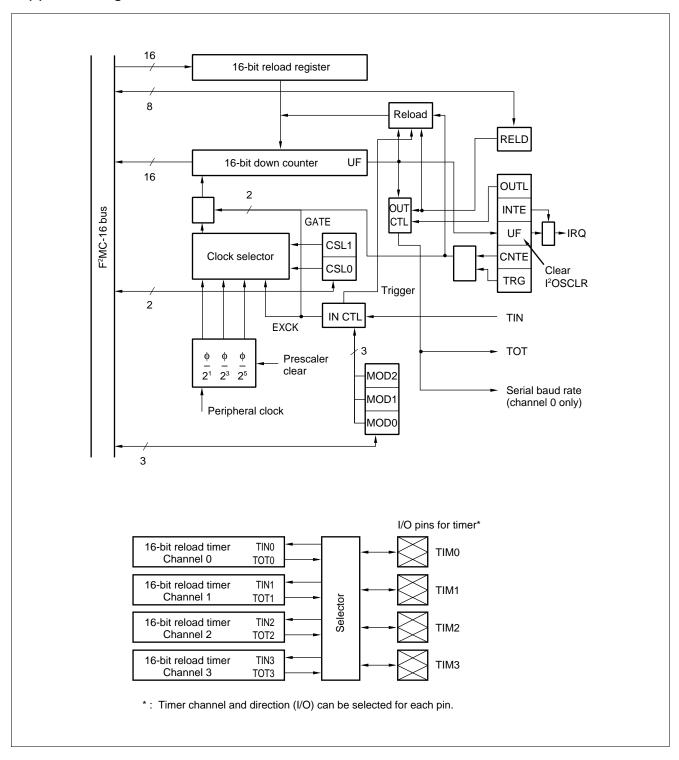

#### 6. 16-bit Reload Timer (with Event Count Function)

The 16-bit reload timer consists of a 16-bit down counter, a 16-bit reload register, control register, and 4 timer pins (I/O set by timer pin select register). Three internal clocks and an external clock can be selected as input clocks. A toggle output waveform is output at the output pin (TOT) in reload mode, while a square wave indicating that the timer is counting is output at the output pin in single-shot mode. The input pin (TIN) can be used for event input in even count mode, and for trigger input or gate input in internal clock mode.

This product has this timer built into four channels.

#### (1) Register Configuration

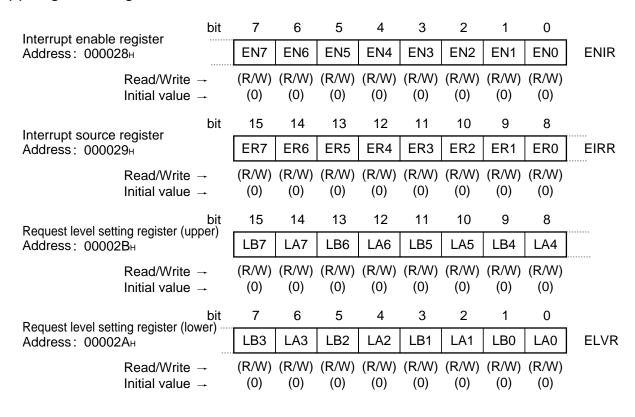

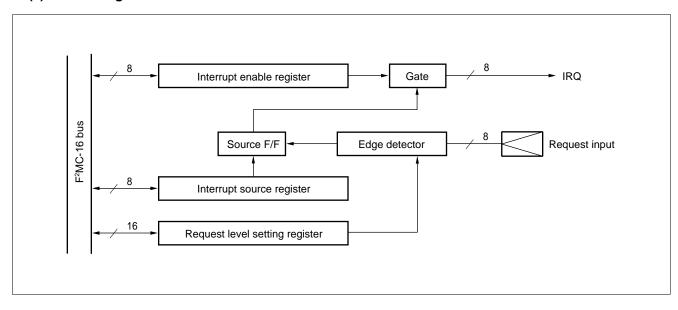

#### 7. External Interrupts

In addition to "H" and "L", rising and falling edge can be selected as the external interrupt level for a total of four interrupt level types.

#### (1) Register Configuration

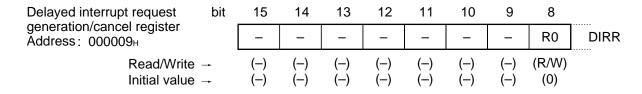

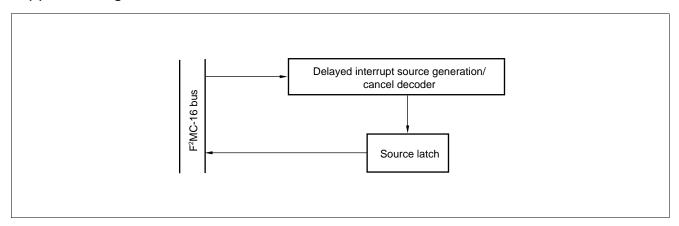

#### 8. Delayed Interrupt Generation Module

The delayed interrupt generation module is used to generate an interrupt for task switching. If this module is used, an interrupt request to the F<sup>2</sup>MC-16L CPU can be generated or cancelled by software.

#### (1) Register Configuration

The DIRR register controls the generation and cancellation of delayed interrupt requests. A delayed interrupt request is generated when "1" is written to this register, while a delayed interrupt request is cancelled when "0" is written here. Request cancel status results upon reset. Although either "0" or "1" may be written into reserved bits, we recommend using the set bit and clear bit instructions when accessing this register in consideration of possible future extensions.

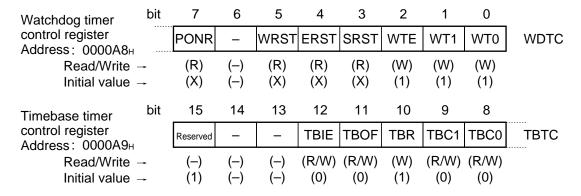

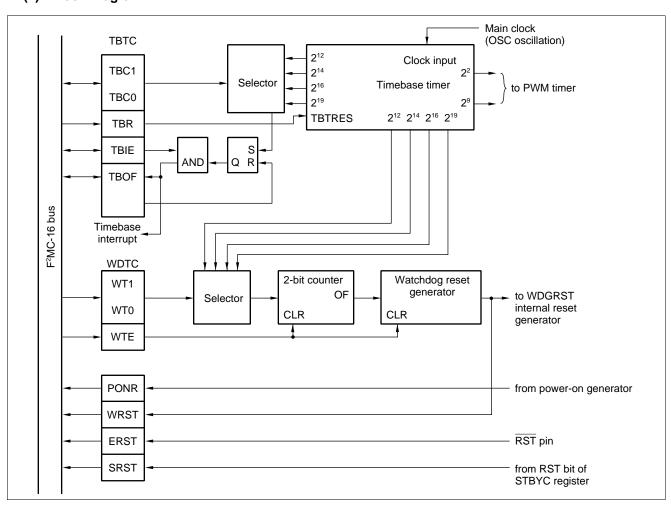

### 9. Watchdog Timer and Timebase Timer Functions

The watchdog timer consists of a 2-bit watchdog counter using carry signals from the 18-bit timebase timer as the clock source, a control register, and a watchdog reset controller.

In addition to an 18-bit timer, the timebase timer consists of a circuit for controlling interval interrupts. Note that the timebase timer uses the main clock regardless of the status of the MCS bit within the CKSCR register.

#### (1) Register Configuration

# 10. Low Power Consumption Controller (CPU intermittent operation function, stable oscillation wait time, and clock multiplier function)

The following operation modes are available: PLL clock mode, PLL sleep mode, clock mode, main clock mode, main sleep mode and stop mode. Operation modes other than PLL clock mode are classified as low power consumption modes.

Main clock mode and main sleep mode are modes where the microcontroller operates using the main clock (OSC oscillation clock) only. In these modes, the main clock divided by two is used as the operation clock and the PLL clock (VCO oscillation clock) is stopped.

In PLL sleep mode and main sleep mode, only the operation clock of the CPU is stopped, while operations besides the CPU clock continue.

In clock mode, only the timebase timer is allowed to operate.

In stop mode, oscillation is stopped, allowing data to be held at the lowest power consumption possible.

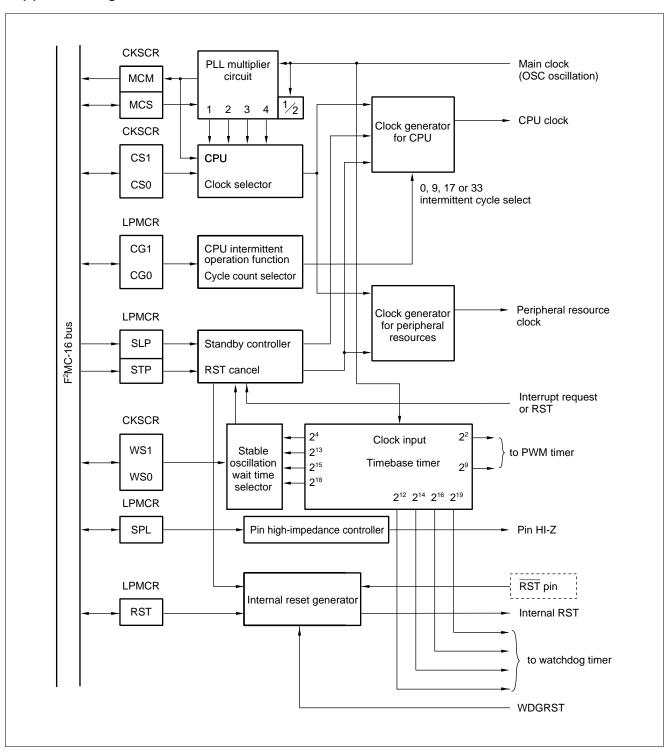

The CPU intermittent operation function causes the clock provided to the CPU to function intermittently when accessing registers, internal memory, internal resources and the external bus. This allows processing to be performed at lower power consumption by reducing the CPU execution speed while continuing to provide a high speed clock to internal resources.

The PLL clock multiplier can be selected as 1, 2, 3 or 4 using the CS1 and CS0 bits.

The stable oscillation wait time for the main clock when stop mode is cancelled can be set using the WS1 and WS0 bits.

#### (1) Register Configuration

#### 11. Interrupt Controller

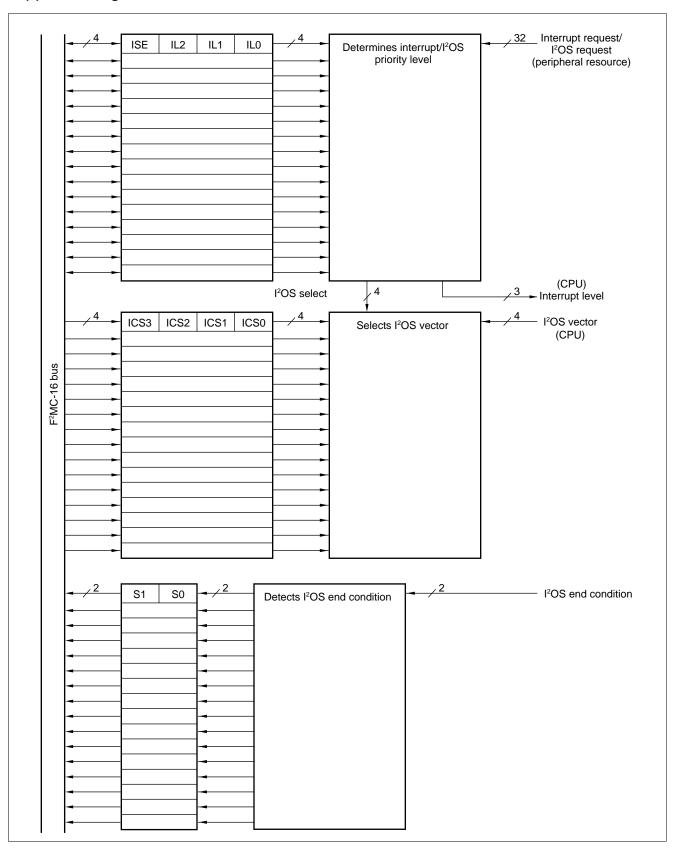

The interrupt control register is located within the interrupt controller. Its status conforms to all I/O possessed by the interrupt function. This register includes the following three functions.

- Sets the interrupt level of the corresponding peripheral resource
- Selects whether to use conventional interrupts or extended intelligent I/O services for the interrupt of the corresponding peripheral resource
- Selects the channel for the extended intelligent I/O services

#### (1) Register Configuration

Note: Since read-modify-write type instructions can cause a malfunction, do not access using these instructions.

<sup>\*8:</sup> P60/RT1/U, P61/RT2/V, P62/RT3/W, P63/X, P64/Y and P65/Z pins

### 2. Recommended Operating Conditions

(Vss = AVss = 0.0 V)

Parameter	Symbol	Rati	ngs	Unit	Remarks
Farameter	Syllibol	Min.	Max.	Oilit	Remarks
Power supply voltage	Vcc	2.7	5.5	\/	During normal operation
Fower supply voltage	Vcc	2.0	5.5	V	Stop operation status is held
Operating temperature	TA	-40	+85	°C	

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

> Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

> No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.

Variation between channels	_	AN0 to AN7	_	_	4	LSB

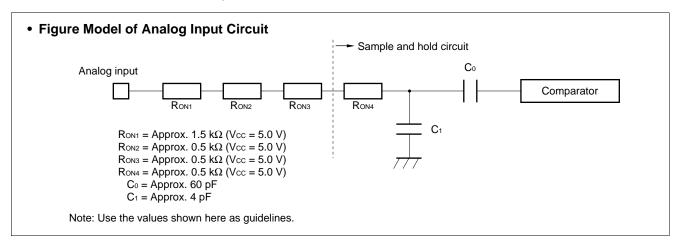

- \*1:  $Vcc = 5.0 \text{ V} \pm 10\%$  at 16 MHz machine clock
- \*2:  $Vcc = 3.0 \text{ V} \pm 10\%$  at 8 MHz machine clock
- \*3: Current when CPU is stopped and A/D converter is not operating (when Vcc = AVcc = AVR = 5.0 V)

Notes: • The relative error becomes larger as the reference voltage (AVR) becomes smaller.

• Be sure to use the A/D converter only when output impedance of the external analog input circuit meets the following conditions.

External circuit output impedance < approx. 7 k $\Omega$ 

- If the output impedance of the external circuit is too high, there may not be enough time to sample the analog voltage. (Sampling time = 3.75 µs @4 MHz (equivalent to internal 16 MHz when multiplying by 4))
- For an external capacitor to be provided outside the chip, its capacity should desirably be thousands times larger than of the capacity in the chip taking in consideration the influence of the capacity destribution of the external and internal capacitors.

#### 6. Definitions of A/D Converter Terms

Resolution : Analog transition observed with an A/D converter.

Analog voltage can be divided in  $1024 = 2^{10}$  parts at 10-bit resolution.

Total error : This refers to the difference between actual and logical values. This error is

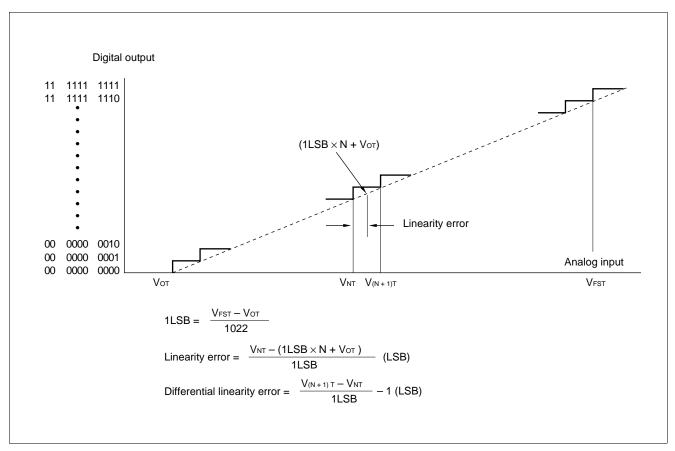

caused by offset errors, gain errors, non-linearity errors and noise.

Linearity error : Deviation of the line drawn between the zero transition point (00 0000 0000  $\leftrightarrow$ 

00 0000 0001) and the full-scale transition point (11 1111 1110  $\leftrightarrow$  11 1111

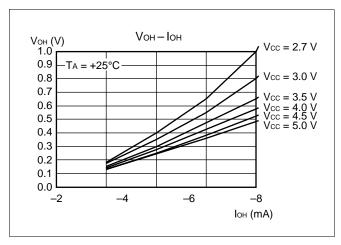

1111) for the device from actual conversion characteristics.

Differential linearity error : Deviation from ideal input voltage required to shift output code by one LSB.

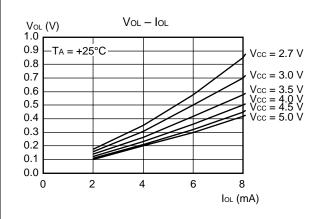

#### **■ EXAMPLES CHARACTERISTICS**

#### (1) "H" Level Output Voltage

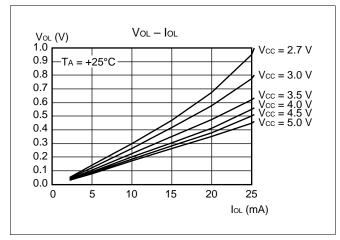

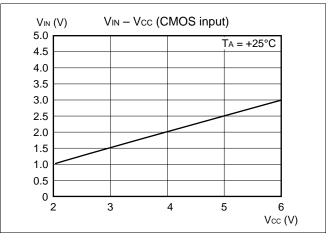

### (2) "L" Level Output Voltage

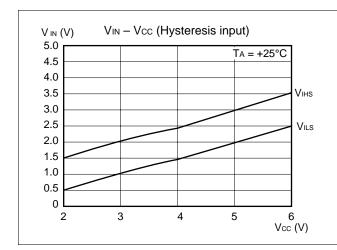

(3) "L" Level Output Voltage (P60 to P65)

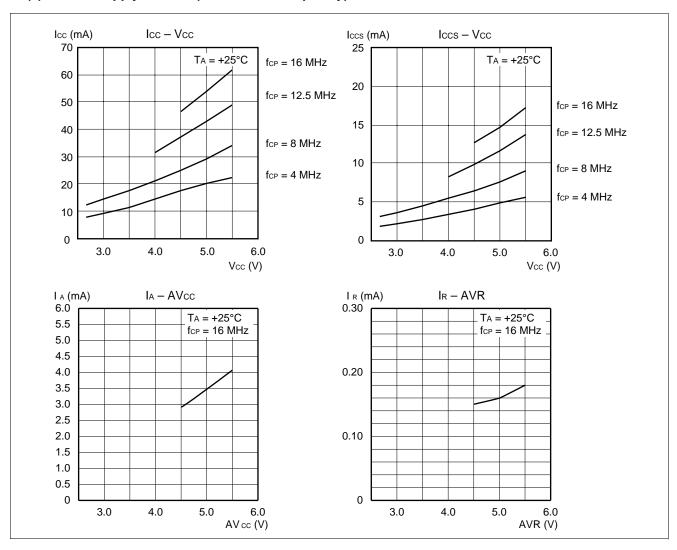

#### (5) "H" Level Input Voltage/"L" Level Input Voltage

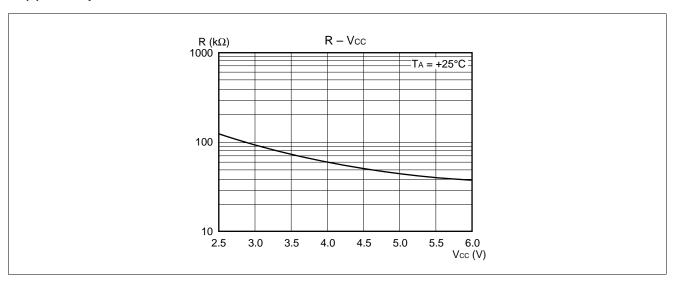

V<sub>IHS</sub>: Threshold when input voltage in hysteresis characteristics is set to "H" level

VILS: Threshold when input voltage in hysteresis characteristics is set to "L" level

#### (6) Power Supply Current (fcp = Internal frequency)

#### (7) Pull-up Resistor

### ■ INSTRUCTIONS (340 INSTRUCTIONS)

Table 1 Explanation of Items in Tables of Instructions

Item	Meaning
Mnemonic	Upper-case letters and symbols: Represented as they appear in assembler.  Lower-case letters: Replaced when described in assembler.  Numbers after lower-case letters: Indicate the bit width within the instruction.
#	Indicates the number of bytes.
~	Indicates the number of cycles. m: When branching n: When not branching See Table 4 for details about meanings of other letters in items.
RG	Indicates the number of accesses to the register during execution of the instruction. It is used calculate a correction value for intermittent operation of CPU.
В	Indicates the correction value for calculating the number of actual cycles during execution of the instruction. (Table 5)  The number of actual cycles during execution of the instruction is the correction value summed with the value in the "~" column.
Operation	Indicates the operation of instruction.
LH	Indicates special operations involving the upper 8 bits of the lower 16 bits of the accumulator.  Z: Transfers "0".  X: Extends with a sign before transferring.  -: Transfers nothing.
АН	Indicates special operations involving the upper 16 bits in the accumulator.  * : Transfers from AL to AH.  - : No transfer.  Z : Transfers 00H to AH.  X : Transfers 00H or FFH to AH by signing and extending AL.
I	Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky bit),
S	N (negative), Z (zero), V (overflow), and C (carry).  * : Changes due to execution of instruction.
Т	- : No change.
N	S: Set by execution of instruction. R: Reset by execution of instruction.
Z	
V	
С	
RMW	Indicates whether the instruction is a read-modify-write instruction. (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory.)  * : Instruction is a read-modify-write instruction.  - : Instruction is not a read-modify-write instruction.  Note: A read-modify-write instruction cannot be used on addresses that have different meanings depending on whether they are read or written.

Table 2 Explanation of Symbols in Tables of Instructions

Symbol	Meaning
A	32-bit accumulator The bit length varies according to the instruction. Byte: Lower 8 bits of AL Word: 16 bits of AL Long: 32 bits of AL:AH
AH AL	Upper 16 bits of A Lower 16 bits of A
SP	Stack pointer (USP or SSP)
PC	Program counter
PCB	Program bank register
DTB	Data bank register
ADB	Additional data bank register
SSB	System stack bank register
USB	User stack bank register
SPB	Current stack bank register (SSB or USB)
DPR	Direct page register
brg1	DTB, ADB, SSB, USB, DPR, PCB, SPB
brg2	DTB, ADB, SSB, USB, DPR, SPB
Ri	R0, R1, R2, R3, R4, R5, R6, R7
RWi	RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7
RWj	RW0, RW1, RW2, RW3
RLi	RL0, RL1, RL2, RL3
dir	Compact direct addressing
addr16 addr24 ad24 0 to 15 ad24 16 to 23	Direct addressing Physical direct addressing Bit 0 to bit 15 of addr24 Bit 16 to bit 23 of addr24
io	I/O area (000000н to 0000FFн)
imm4 imm8 imm16 imm32 ext (imm8)	4-bit immediate data 8-bit immediate data 16-bit immediate data 32-bit immediate data 16-bit data signed and extended from 8-bit immediate data
disp8 disp16	8-bit displacement 16-bit displacement
bp	Bit offset
vct4 vct8	Vector number (0 to 15) Vector number (0 to 255)
( )b	Bit address

10 11 12 13 14 15 16 17	@RW0 + disp8 @RW1 + disp8 @RW2 + disp8 @RW3 + disp8 @RW4 + disp8 @RW5 + disp8 @RW5 + disp8 @RW6 + disp8			Register indirect with 8-bit displacement	1
18 19 1A 1B	@RW0 + disp16 @RW1 + disp16 @RW2 + disp16 @RW3 + disp16			@RW1 + disp16 displacement @RW2 + disp16	
1C 1D 1E 1F	@RW0 + RW7 @RW1 + RW7 @PC + disp16 addr16			Register indirect with index Register indirect with index PC indirect with 16-bit displacement Direct address	0 0 2 2

Note: The number of bytes in the address extension is indicated by the "+" symbol in the "#" (number of bytes) column in the tables of instructions.

Table 4 Number of Execution Cycles for Each Type of Addressing

		(a)	Number of register
Code	Operand	Number of execution cycles for each type of addressing	accesses for each type of addressing
00 to 07	Ri RWi RLi	Listed in tables of instructions	Listed in tables of instructions
08 to 0B	@RWj	2	1
0C to 0F	@RWj +	4	2
10 to 17	@RWi + disp8	2	1
18 to 1B	@RWj + disp16	2	1
1C	@RW0 + RW7	4	2
1D	@RW1 + RW7	4	2
1E	@PC + disp16	2	0
1F	addr16	1	U

Note: "(a)" is used in the "~" (number of states) column and column B (correction value) in the tables of instructions.

Table 5 Correction Values for Number of Cycles Used to Calculate Number of Actual Cycles

	(b)	byte	vord	(d) long				
Operand	Number of cycles	Number of access	Number of cycles	Number of access	Number of cycles	Number of access		
Internal register	+0	1	+0	1	+0	2		
Internal memory even address Internal memory odd address	+0 +0	1 1	+0 +2	1 2	+0 +4	2 4		
Even address on external data bus (16 bits) Odd address on external data bus (16 bits)	+1 +1	1	+1 +4	1 2	+2 +8	2 4		
External data bus (8 bits)	+1	1	+4	2	+8	4		

Notes: • "(b)", "(c)", and "(d)" are used in the "~" (number of states) column and column B (correction value) in the tables of instructions.

• When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

Table 6 Correction Values for Number of Cycles Used to Calculate Number of Program Fetch Cycles

Instruction	Byte boundary	Word boundary
Internal memory	_	+2
External data bus (16 bits)	_	+3
External data bus (8 bits)	+3	_

Notes: • When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

• Because instruction execution is not slowed down by all program fetches in actuality, these correction values should be used for "worst case" calculations.

m: RW0 value (counter value)

n: Loop count

<sup>\*1: 5</sup> when RW0 is 0, 4 + 7  $\times$  (RW0) for count out, and 7  $\times$  n + 5 when match occurs

<sup>\*2: 5</sup> when RW0 is 0,  $4 + 8 \times (RW0)$  in any other case

<sup>\*3: (</sup>b)  $\times$  (RW0) + (b)  $\times$  (RW0) when accessing different areas for the source and destination, calculate (b) separately for each.

<sup>\*4: (</sup>b)  $\times$  n

<sup>\*5: 2 × (</sup>RW0)

<sup>\*6:</sup>  $(c) \times (RW0) + (c) \times (RW0)$  when accessing different areas for the source and destination, calculate (c) separately for each.

<sup>\*7: (</sup>c)  $\times$  n

<sup>\*8: 2 × (</sup>RW0)

### **■ MASK OPTION LIST**

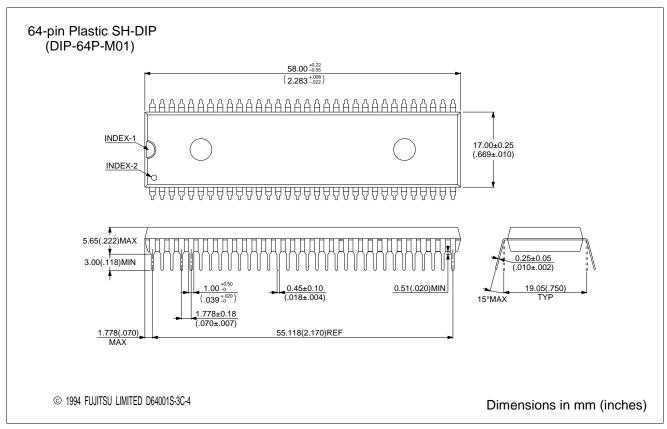

No.	Part number	MB60 MB90		МВ90	P663A
NO.	Specifying procedure	Specify ordering	when masking		EPROM ammer
1	P00 to P07 P10 to P17 P20 to P27 P30 to P33 P40 to P47 P60 to P66 RST DTTI	Pull-up resistor can each pin	be selected for	Pull-up resistor ca each pin	n be selected for
_	MD2	Pull-down resistor	_ Can be selected	Cannot be selecte resistor not provid	
2	MD1	Pull-up resistor	all at once	Pull-up resistor	Can be selected
	MD0	Pull-up resistor		Pull-up resistor	all at once
3	Accept asynchronous reset input  Accepted Not accepted	Can be selected		Can be selected	

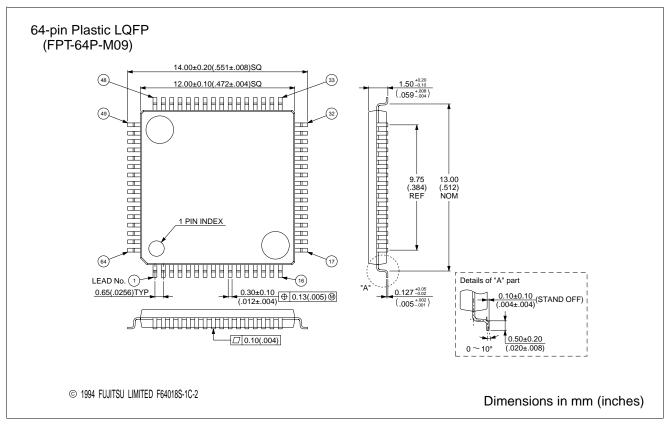

- Notes: A specification of "yes" for accept asynchronous reset input refers to a function whereby reset input is accepted when oscillation for output ports (including peripheral resource output) is stopped and port output (including peripheral resource output) is forced Hi-z. Note, however, that since internal reset (reset of the CPU and peripheral resources) is synchronized with the clock, the CPU and peripheral resources are not initialized when the clock is stopped.
  - For details on writing to the MB90P663A, see Chapter 6, "■ PROGRAMMING THE MB90P663A EPROM".
  - Use of a pull-up/pull-down resistors for the mode pins (MD2 to MD0) can be selected separately for each pin. If "yes" is selected, a pull-up is attached to MD0 and MD1 and a pull-down to MD2 for mask ROM versions. A pull-up is attached to MD0 and MD1, but a pull-down is not attached to MD2 for OTP versions.
  - Since it takes eight machine cycles to make option settings for the MB90P663A, options cannot be set between when power is first turned on and the clock is supplied. (This results in a setting of no pull-up for all pins and accept asynchronous reset input.)

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
