100343 Low Power 8-Bit Latch

General Description

The 100343 contains eight D-type latches, individual inputs, (D_n) , outputs (Q_n) , a common enable pin (\overline{E}) , and a latch enable pin $(L\overline{E})$. A Q output follows its D input when both \overline{E} and $L\overline{E}$ are LOW. When either \overline{E} or LE (or both) are HIGH, a latch stores the last valid data present on its D input prior to \overline{E} or $L\overline{E}$ going HIGH.

The 100343 outputs are designed to drive a 50 Ω termination resistor to -2.0V. All inputs have 50 k Ω pull-down resistors.

October 1989 Revised August 2000 00343 Low Power 8-Bit Latch

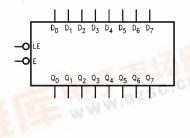

Features

- Low power operation
- 2000V ESD protection
- Voltage compensated operating range = -4.2V to -5.7V
- Available to industrial grade temperature range

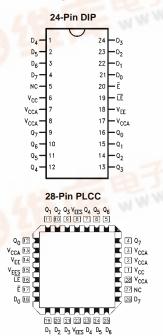

Ordering Code:

Note 2: The "Absolute Maximum Ratings" re those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation. Note 3: ESD testing conforms to MIL-STD-883, Method 3015.

Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.

Note 7: Output-to-Output Skew is defined as the absolute value of the difference between the actual propagation delay for any outputs within the same packaged device. The specifications apply to any outputs switching in the same direction either HIGH-to-LOW (t_{OSHL}), or LOW-to-HIGH (t_{OSLH}), or in opposite directions both HL and LH (t_{OST}). Parameters t_{OST} and t_{PS} guaranteed by design.
