## 74LCX841 Low Voltage 10-Bit Transparent Latch with 5V Tolerant Inputs and Outputs

#### **General Description**

The LCX841 consists of ten latches with 3-STATE outputs for bus organized system applications. The device is designed for low voltage (2.5V or 3.3V)  $V_{CC}$  applications with capability of interfacing to a 5V signal environment. The LCX841 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining CMOS low power dissipation.

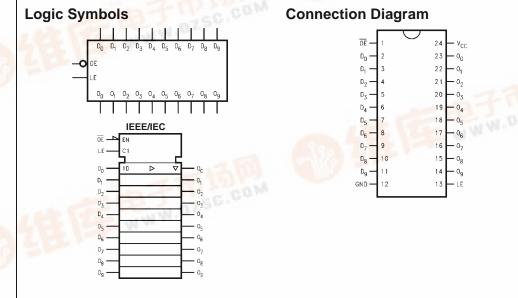

#### **Features**

- 5V tolerant inputs and outputs
- 2.3V 3.6V V<sub>CC</sub> specifications provided
- 8.0 ns t<sub>PD</sub> max (V<sub>CC</sub> = 3.3V), 10 μA I<sub>CC</sub> max
- Power-down high impedance inputs and outputs
- Supports live insertion/withdrawal (Note 1)
- $\pm 24$  mA output drive (V<sub>CC</sub> = 3.0V)
- Implements patented noise/EMI reduction circuitry
- Latch-up performance exceeds 500 mA
- ESD performance:
  - Human Body Model > 2000V Machine Model > 200V

Note 1: To ensure the high-impedance state during power up or down,  $\overline{\text{OE}}$  should be tied to V<sub>CC</sub> through a pull-up resistor: the minimum value or the resistor is determined by the current-sourcing capability of the driver.

## **Functional Description**

The LCX841 consists of ten D-type latches with 3-STATE outputs. The flip-flops appear transparent to the data when Latch Enable (LE) is HIGH. This allows asynchronous operation, as the output transition follows the data in transition.

On the LE HIGH-to-LOW transition, the data that meets the setup and hold time is latched. Data appears on the bus when the Output Enable  $(\overline{OE})$  is LOW. When  $\overline{OE}$  is HIGH the bus output is in the high impedance state.

Note 2: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3:  $I_O$  Absolute Maximum Rating must be observed.

Note 4: Unused inputs must be held HIGH or LOW. They may not float.
