DS1487

Low Power RS-485 1/4 Unit Load Multipoint Transceiver

General Description

The DS1487 is a low-power transceiver for RS-485 and RS-422 communication. The device contains one driver and one receiver. The drivers slew rate allows for operation up to 2.0 Mbps (see Applications Information section). The transceiver presents 1/4 unit loading to the RS-485 bus allowing up to 128 nodes to be connected together without the use of repeaters.

The transceiver draws 200 μ A of supply current when unloaded or fully loaded with the driver disabled and operates from a single +5V supply.

The driver is short-circuit current limited and is protected against excessive power dissipation by thermal shutdown circuitry that places the driver outputs into TRI-STATE® (High Impedance state) under fault conditions. The driver guarantees a minimum of 1.5V differential output voltage with maximum loading across the common mode range (V_{OD3}).

The receiver has a failsafe feature that guarantees a logic-high output if the input is open circuit.

The DS1487 is available in surface mount and DIP packages.

Features

- Meets TIA/EIA RS-485 multipoint standard
- Allows up to 128 transceivers on the bus (1/4 U.L.)
- Guaranteed full load output voltage (V_{OD3})
- Low quiescent current: 200 μ A typ
- -7V to +12V common-mode input voltage range
- TRI-STATE outputs on driver and receiver
- AC performance:
 - Driver transition time: 25 ns typ
 - Driver propagation delay: 40 ns typ
 - Driver skew: 1 ns typ
 - Receiver propagation delay: 200 ns typ
 - Receiver skew: 20 ns typ
- Half-duplex flow through pinout
- Operates from a single 5V supply
- Current-limiting and thermal shutdown for driver overload protection
- Pin and functional compatible with MAX1487

t_{SKEW}	Differential Skew $ t_{PHLD} - t_{PLHD} $		0	20	50	ns
t_{ZH}	Receiver Enable to Output High	$C_L = 15\text{ pF}$		45	150	ns
t_{ZL}	Receiver Enable to Output Low			40	150	ns
t_{LZ}	Receiver Disable from Output Low			50	150	ns
t_{HZ}	Receiver Disable from Output High			55	150	ns
f_{max}	Maximum Data Rate	(Note 10)	2.0			Mbps

Note 2: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.

Note 3: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except $V_{OD1/2/3}$ and V_{ID} .

Note 4: All typicals are given for: $V_{CC} = +5.0\text{V}$, $T_A = +25^\circ\text{C}$.

Note 5: $\Delta|V_{OD}|$ and $\Delta|V_{OC}|$ are changes in magnitude of V_{OD} and V_{OC} respectively, that occur when the input changes state.

Note 6: I_{IN2} includes the receiver input current and driver TRI-STATE leakage current.

Note 7: Supply current specification is valid for loaded transmitters when $DE = 0\text{V}$ or enabled ($DE = H$) with no load.

Note 8: $f = 1\text{ MHz}$, t_r and $t_f \leq 6\text{ ns}$, $Z_O = 50\Omega$.

Note 9: C_L includes jig and probe capacitance.

Note 10: f_{max} is the guaranteed data rate for 50 ft of twisted pair cable. f_{max} may be conservatively determined from the ratio of driver transition time (t_r) to the data rate unit interval ($1/f_{max}$). Using a 10% ratio yields $f_{max} = (0.1)/50\text{ ns} = 2.0\text{ Mb/s}$. Higher data rates may be supported by allowing larger ratios.

Pin Descriptions

Pin #	I/O	Name	Function
1	O	RO	Receiver Output: If $A > B$ by 200 mV, RO will be high; If $A < B$ by 200 mV, RO will be low. RO will be high also if the inputs (A and B) are open (non-terminated).
2	I	RE (Note 1)	Receiver Output Enable: RO is enabled when RE (Note 1) is low; RO is in TRI-STATE when RE (Note 1) is high.
3	I	DE	Driver Output Enable: The driver outputs (A and B) are enabled when DE is high; they are in TRI-STATE when DE is low. Pins A and B also function as the receiver input pins (see below).
4	I	DI	Driver Input: A low on DI forces A low and B high while a high on DI forces A high and B low when the driver is enabled.
5	NA	GND	Ground
6	I/O	A	Non-inverting Driver Output and Receiver Input pin. Driver output levels conform to RS-485 signaling levels.
7	I/O	B	Inverting Driver Output and Receiver Input pin. Driver output levels conform to RS-485 signaling levels.
8	NA	V_{CC}	Power Supply: $4.75V \leq V_{CC} \leq 5.25V$

Applications Information

The DS1487 is a low power transceiver designed for use in RS-485 multipoint applications. The DS1487 can transmit data up to 2.0 Mbps based on a ratio of driver transition time to the unit interval (bit time) of 10%. This maximum data rate may be further limited by the interconnecting media. The DS1487 provides a $\frac{1}{4}$ unit load to the RS-485 bus across the common mode range of $-7V$ to $+12V$. This allows up to 128 transceivers ($\frac{1}{4}$ unit load) to be connected to the bus. The

DS1487 also guarantees the driver's output differential voltage into a worst case load that models standard termination loads and 32 unit loads ($=128$ DS1487's) referenced to the maximum common mode voltage extremes. With a minimum of 1.5V swing into this load, a 1.3V differential noise margin is supported along with the standard common mode rejection range of the receivers.

Applications Information (Continued)

Due to the multipoint nature of the bus, contention between drivers may occur. This will not cause damage to the drivers since they feature short-circuit protection and also thermal shutdown protection. Thermal shutdown senses die temperature and puts the driver outputs into TRI-STATE if a fault condition occurs that causes excessive power dissipation which can elevate the junction temperature to $+150^{\circ}\text{C}$.

A typical multipoint application is shown in the following figure. Note that termination is typically required but is only located at the two ends of the cable (not on every node). Commonly pull up and pull down resistors may be required at one end of the bus to provide a failsafe bias. These resistors provide a bias to the line when all drivers are in TRI-STATE. See National Application Note 847 for a complete discussion of failsafe biasing of differential buses.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
