

Low-Voltage, Dual-Supply, SPST, CMOS Analog Switches

MAX4503/MAX4504

General Description

The MAX4503/MAX4504 are low-voltage, dual-supply, single-pole/single-throw (SPST), CMOS analog switches. The MAX4503 is normally open (NO). The MAX4504 is normally closed (NC).

These CMOS switches can operate continuously with dual supplies between $\pm 1.5V$ and $\pm 6V$. Each switch can handle rail-to-rail analog signals. The off-leakage current is only 1nA at +25°C or 10nA at +85°C.

The digital input is CMOS-logic compatible when using $\pm 5V$ supplies. A unique logic input architecture allows this even though the parts have no ground pin.

For single-supply operation, use the MAX4501/MAX4502, which are pin-for-pin equivalents.

Features

- ◆ Available in SOT23-5 Package
- ◆ Dual-Supply Operation from $\pm 1V$ to $\pm 6V$
- ◆ Guaranteed On-Resistance: **250Ω with $\pm 5V$ Supplies**
- ◆ Guaranteed Low Off-Leakage Currents: **1nA at +25°C**
10nA at +85°C
- ◆ Guaranteed Low On-Leakage Currents: **2nA at +25°C**
20nA at +85°C
- ◆ Guaranteed Low Charge Injection: **10pC Max**
- ◆ Fast Switching Speed: **t_{ON} = 150ns, t_{OFF} = 100ns**
- ◆ CMOS-Logic Compatible Input

Applications

- Battery-Operated Equipment
- Audio and Video Signal Routing
- Low-Voltage Data-Acquisition Systems
- Communications Circuits
- Cellular Phones
- PCMCIA Cards
- Modems

Pin Configurations

Low-Voltage, Dual-Supply, SPST, CMOS Analog Switches

ABSOLUTE MAXIMUM RATINGS

(Voltages Referenced to V₋)

V ₊	-0.3V, +13V
Voltage into Any Terminal (Note 1)	-0.3V to (V ₊ + 0.3V) or ±10mA (whichever occurs first)
Continuous Current into Any Terminal.....	±10mA
Peak Current, NO ₋ or COM ₋ (pulsed at 1ms,10% duty cycle).....	±20mA
Continuous Power Dissipation (T _A = +70°C)	
8-Pin Plastic DIP (derate 9.09mW/°C above +70°C) ...	727mW
8-Pin SO (derate 5.88mW/°C above +70°C).....	471mW

5-Pin SOT23-5 (derate 7.1mW/°C above +70°C)	571mW
8-Pin CERDIP (derate 8.00mW/°C above +70°C).....	640mW
Operating Temperature Ranges	
MAX4503C ₋ /MAX4504C ₋	0°C to +70°C
MAX4503E ₋ /MAX4504E ₋	-40°C to +85°C
MAX4503MJA/MAX4504MJA	-55°C to +125°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10sec)	+300°C

Note 1: Voltages on any signal terminal exceeding V₊ or V₋ are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS—±5V Supply

(V₊ = +4.5V to +5.5V, V₋ = -4.5V to -5.5V, V_{INH} = 3.5V, V_{INL} = 1.5V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.)

Note 2: The algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.

Note 4: Guaranteed, not production tested.

Note 3: Leakage parameters are 100% tested at maximum rated hot operating temperature, and guaranteed by correlation at +25°C.

Note 5: SOT packaged parts are 100% tested at +25°C. Limits at maximum and minimum rated temperature are guaranteed by design and correlation limits at +25°C.

Low-Voltage, Dual-Supply, SPST, CMOS Analog Switches

Typical Operating Characteristics

($V_+ = +5V$, $V_- = -5V$, $T_A = +25^\circ C$, unless otherwise noted.)

MAX4503/MAX4504

Low-Voltage, Dual-Supply, SPST, CMOS Analog Switches

Pin Description

PIN				NAME	FUNCTION
MAX4503		MAX4504			
DIP/SO	SOT23-5	DIP/SO	SOT23-5		
1	1	1	1	COM	Analog Switch Common Terminal
2, 3, 5	–	2, 3, 5	–	N.C.	No Connect (not internally connected)
4	5	4	5	V+	Positive (analog and digital) Supply Voltage Input
6	4	6	4	IN	Digital Control Input
7	3	7	3	V-	Negative (analog) Supply Voltage Input
8	2	–	–	NO	Analog Switch Normally Open Terminal
–	–	8	2	NC	Analog Switch Normally Closed Terminal

Note: NO, NC, and COM pins are identical and interchangeable. Either may be considered as an input or output; signals pass equally well in both directions.

Applications Information

Power-Supply Considerations

The MAX4503/MAX4504's construction is typical of most CMOS analog switches, except they have only two supply pins: V+ and V-. These voltages set the analog voltage limits of the switch. Reverse ESD-protection diodes are internally connected between IN and each analog signal pin and both V+ and V-. If any analog signal exceeds V+ or V-, one of these diodes will conduct. During normal operation, these (and other) reverse-biased ESD diodes leak, forming the only current drawn from V-. Additional current flows through V+ from the logic-level translator.

Virtually all the analog leakage current is provided through the ESD diodes. Although the ESD diodes on a given signal pin are identical and therefore fairly well balanced, they are reverse biased differently. Each is biased by either V+ or V- and the analog signal. This means their leakages will vary as the signal varies. The *difference* in the two diode leakages to the V+ and V- pins constitutes the analog-signal-path leakage current. All analog leakage current flows between each pin and one of the supply terminals, not to the other switch terminal. This is why both sides of a given switch can show leakage currents of either the same or opposite polarity.

There is no connection between the analog signal paths and V+ or V-.

V+ and V- also power the internal logic and logic-level translators. Since there is no ground pin, the logic input

has a low-current pull-up to V+ and the logic limit is set by an internal comparator referenced to V+. The logic-level translators convert the logic levels to switched V+ and V- signals, to drive the gates of the analog signals. This drive signal is the only connection between the logic supplies (and signals) and the analog supplies. COM, NO, and NC pins have ESD-protection diodes to V+ and V-.

The logic is CMOS compatible when V+ is +5V. CMOS compatibility is maintained with all V+ values, assuming that the CMOS logic is operated from the same V+ supply. Since the MAX4503/MAX4504 have no ground pins, the logic levels are internally referenced to V+.

Do not connect the MAX4503/MAX4504 V+ to +3V and connect the logic-level pins to TTL-logic-level signals. TTL levels can exceed +3V and violate the absolute maximum ratings, damaging the part and/or external circuits.

High-Frequency Performance

In 50Ω systems, signal response is reasonably flat up to 50MHz. (see *Typical Operating Characteristics*). Above 20MHz the on-response has several minor peaks which are highly layout dependent. The problem is not in turning the switch on, but in turning it off. The off-state switch acts like a capacitor, and passes higher frequencies with less attenuation. At 10MHz, off isolation is about -65dB in 50Ω systems, becoming worse (approximately 20dB per decade) as frequency increases. Higher circuit impedances also make off isolation worse.
