description

This 18-bit universal bus transceiver is designed for 1.65-V to 3.6-V V_{CC} operation.

Data flow in each direction is controlled by output-enable ($\overline{OEAB}$ and $\overline{OEBA}$) and clock-enable ($\overline{CLKENBA}$) inputs. For the A-to-B data flow, the data flows through a single buffer. The B-to-A data can flow through a four-stage pipeline register path, or through a single register path, depending on the state of the select ($\overline{SEL}$) input.

Data is stored in the internal registers on the low-to-high transition of the clock (CLK) input, provided that the appropriate $\overline{CLKENBA}$ input is low. The B-to-A data transfer is synchronized with CLK.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

The SN74ALVCH16524 is characterized for operation from –40°C to 85°C.

Continuous current through each V_{CC} or GND . . . . . ±100 mA
Package thermal impedance, θ_{JA} (see Note 3): DGG package . . . . . 81°C/W
DL package . . . . . 74°C/W
Storage temperature range, T_{stg} . . . . . –65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
2. This value is limited to 4.6 V maximum.
3. The package thermal impedance is calculated in accordance with JESD 51.
