LM3722/LM3723/LM3724
5-Pin Microprocessor Reset Circuits

General Description

The LM3722/LM3723/LM3724 microprocessor supervisory circuits monitor the power supplies in microprocessor and digital systems. They provide a reset to the microprocessor during power-up, power-down, brown-out conditions, and manual reset.

The LM3722/LM3723/LM3724 asserts a reset signal whenever the supply decreases below the factory-programmed reset threshold for at least 100 ms. The reset signal remains asserted for 190 ms after V_{CC} rises above the threshold.

The LM3722 has an active-low $\overline{\text{RESET}}$ push-pull output. The LM3723 has an active-high RESET push-pull output. The LM3724 has an active-low open-drain $\overline{\text{RESET}}$ output.

Three standard reset voltage options are available, suitable for monitoring 5V, 3.3V, and 2.5V supply voltages. Additional reset voltages are also available; contact National Semiconductor for details.

With a low supply current of only 6µA, the LM3722/LM3723/LM3724 are ideal for use in portable equipment. The LM3722/LM3723/LM3724 are available in the 5-pin SOT23 package.

Features

- Precise monitoring of 2.5V, 3.3V, and 5V supply voltages
- Fully specified over temperature
  - Industrial: −40˚C to +85˚C
  - Extended: −40˚C to +125˚C
- 100 ms minimum Power-On Reset pulse width, 190 ms typical:
  - Active-Low $\overline{\text{RESET}}$ Output (LM3722)
  - Active-High RESET Output (LM3723)
  - Active-Low $\overline{\text{RESET}}$ Open Drain Output (LM3724)
- Guaranteed $\overline{\text{RESET}}$ Output valid for $V_{CC} \geq 1V$
- Low Supply Current, 6µA typical
- Power supply transient immunity
- Compatible with MAX811/812 applications

Applications

- Microprocessor Systems
- Computers
- Controllers
- Intelligent Instruments
- Portable/Battery-Powered Equipment

Custom voltages and improved accuracies are available, subject to minimum orders. Contact your local National Semiconductor Sales Office for information.

Pin Description

PIN	NAME	FUNCTION
1	GND	Ground reference
2	GND	Ground reference, device substrate, connect to ground.
3	$\overline{\text{RESET}}$ LM3722/LM3724	Active-low output. $\overline{\text{RESET}}$ remains low while V_{CC} is below the reset threshold voltage, and for 190 ms after V_{CC} rises above the reset threshold voltage.
	RESET LM3723	Active-high output. RESET remains high while V_{CC} is below the reset threshold, and for 190 ms after V_{CC} rises above the reset threshold.
4	$\overline{\text{MR}}$	Active-low input. Reset is asserted whenever this pin is pulled low and remains asserted for 190 ms after the $\overline{\text{MR}}$ pin goes high. May be left open.
5	V_{CC}	Supply Voltage (+5V, +3.3V, or +2.5V, nominal)

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

V_{CC}, $\overline{MR}$	−0.3V to 6.0V
RESET, $\overline{RESET}$	−0.3V to (V_{CC}+ 0.3V)
Input Current, V_{CC} Pin	20mA
Output Current, RESET, $\overline{RESET}$ Pin	20mA
ESD Rating (Note 2)	2kV
Continuous Power Dissipation (T_A = +70˚C)	
SOT-23 (Note 3)	320mW
Operating Temperature Range	
Industrial:	−40˚C to +85˚C
Extended:	−40˚C to +125˚C
Maximum Junction Temperature	125˚C
Storage Temperature Range	−65˚C to +160˚C
Lead Temperature (soldering, 10sec)	+300˚C

Electrical Characteristics

Typical values are at T_A = +25˚C. Limits with standard typeface are for T_A = +25˚C, and limits in boldface type apply for the operating temperature range (−40˚C to +85˚C) for LM372_IM5X, and (−40˚C to +125˚C) for LM372_EM5X, unless otherwise noted. (Note 4)

Symbol	Parameter	Conditions		Min	Typ	Max	Units
V_{CC}	V_{CC} Range			**1.0**		**5.5**	V
I_{CC}	Supply Current (I_{LOAD} = 0A)	LM372 _ -4.63	V_{CC} = 5.5V		8	**15**	µA
		LM372 _ -3.08	V_{CC} = 3.6V		7	**10**

V_{IL}						**0.8**	
V_{IH}		V_{CC} > $V_{TH(MAX)}$, LM372_ -3.08, LM372_ -2.32		**0.7 V_{CC}**			
V_{IL}						**0.25 V_{CC}**	
	$\overline{MR}$ Pull-Up Resistance				22		kΩ
V_{OL}	$\overline{RESET}$ Output Voltage Low (LM3722)	V_{CC} = V_{TH} min, I_{SINK} = 1.2mA, (LM3722-2.32/3.08)				**0.3**	V
		V_{CC} = V_{TH} min, I_{SINK} = 3.2mA, (LM3722-4.63)				**0.4**	
		V_{CC} > 1V, I_{SINK} = 50µA				**0.3**	
V_{OH}	$\overline{RESET}$ Output Voltage High (LM3722)	V_{CC} > V_{TH} max, I_{SOURCE} = 500µA, (LM3722-2.32/3.08)		**0.8V_{CC}**			V
		V_{CC} > V_{TH} max, I_{SOURCE} = 800µA, (LM3722-4.63)		**V_{CC}−1.5**			
V_{OL}	RESET Output Voltage Low (LM3723)	V_{CC} = V_{TH} max, I_{SINK} = 1.2mA (LM3723 -2.32/3.08)				**0.3**	V
		V_{CC} = V_{TH} max, I_{SINK} = 3.2mA (LM3723 -4.63)				**0.4**	

Electrical Characteristics (Continued)

Typical values are at T_A = +25˚C. Limits with standard typeface are for T_A = +25˚C, and limits in boldface type apply for the operating temperature range (−40˚C to +85˚C) for LM372_IM5X, and (−40˚C to +125˚C) for LM372_EM5X, unless otherwise noted. (Note 4)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
V_{OH}	RESET Output Voltage High (LM3723)	1.8V < V_{CC} < V_{TH} min, I_{SOURCE} = 150µA	**0.8V_{CC}**			V
V_{OL}	$\overline{\text{RESET}}$ Output Voltage Low (LM3724)	V_{CC} = V_{TH} min, I_{SINK} = 1.2 mA (LM3724 -2.32/3.08)			**0.3**	V
		V_{CC} = V_{TH} min, I_{SINK} = 3.2 mA (LM3724 -4.63)			**0.4**	
		V_{CC} > 1V, I_{SINK} = 50µA			**0.3**	
I_{IN}	$\overline{\text{RESET}}$ Output Leakage Current (LM3724)	V_{CC} > V_{TH}, $\overline{\text{RESET}}$ = 5.5V			**0.5**	µA

Note 1: Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which the device operates correctly. Operating ratings do not imply guaranteed performance limits. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics.

Note 2: The human body model is a 100pF capacitor discharged through a 1.5kΩ resistor into each pin.

Note 3: At elevated temperatures, devices must be derated based on package thermal resistance. The device in the SOT23-5 package must be derated at 4.5mW/˚C at ambient temperatures above 70˚C. The device has internal thermal protection.

Note 4: Production testing done at T_A = +25˚C. Limits over the operating temperature range are guaranteed through correlation using Statistical Quality Control (SQC) methods.

Note 5: $\overline{\text{RESET}}$ Output for LM3722 and LM3724, RESET output for LM3723.

Note 6: Glitches of 100 ns or less typically will not generate a reset pulse.

Circuit Information

Reset Output

The reset input of a µP initializes the device into a known state. The LM3722/LM3723/LM3724 microprocessor voltage monitoring circuits assert a forced reset output to prevent code execution errors during power-up, power-down, and brownout conditions.

$\overline{RESET}$ is guaranteed valid for $V_{CC} \geq 1V$. Once V_{CC} exceeds the reset threshold, an internal timer maintains the output for the reset timeout period. After this interval, reset goes high and the microprocessor initializes itself into a known state. The LM3722 and LM3724 offer an active-low $\overline{RESET}$; the LM3723 offers an active-high RESET.

As V_{CC} drops below the reset threshold (such as during a brownout), the reset activates (see the *Negative-Going V_{CC} Transients* section). When V_{CC} again rises above the reset threshold, the internal timer starts. Reset holds until V_{CC} exceeds the reset threshold for longer than the reset timeout period. After this time, reset releases.

Additionally, the Manual Reset input ($\overline{MR}$) will initiate a forced reset. See the *Manual Reset Input* section.

The LM3722/LM3723/LM3724 reset outputs ignore short duration glitches on V_{CC} and $\overline{MR}$. See the *Applications Information* section for details.

Reset Threshold

The LM3722/LM3723/LM3724 are available with reset voltages of 4.63V, 3.08V, and 2.32V which are suitable for monitoring 5.0V, 3.3V, and 2.5V supplies respectively. Other reset thresholds in the 2.20V to 5.0V range, in 10 mV steps, are available; contact National Semiconductor for details.

Manual Reset Input ($\overline{MR}$)

Many µP-based products require a manual reset capability, allowing the operator to initiate a reset. The $\overline{MR}$ input is fully debounced and provides an internal 22 kΩ pull-up. When the $\overline{MR}$ input is pulled below V_{IL} ($0.25V_{CC}$) for more than 100 ns, reset is asserted after a typical delay of 2 µs. Reset remains active as long as $\overline{MR}$ is held low, and releases after $\overline{MR}$ rises above V_{IH} and the reset timeout period expires. Use $\overline{MR}$ with digital logic to assert reset or to daisy chain supervisory circuits.

Applications Information

Benefits of Precision Reset Thresholds

A microprocessor supply supervisor must provide a reset output within a predictable range of the supply voltage. A common threshold range is between 5% and 10% below the nominal supply voltage. The 4.63V, 3.08V and 2.32V options of the LM3722/LM3723/LM3724 use highly accurate circuitry to ensure that the reset threshold occurs only within this range (for 5.0V, 3.3V and 2.5V supplies). *Table 1* shows how the standard reset thresholds apply to 5.0V, 3.3V, and 2.5V nominal supply voltages.

Applications Information (Continued)

TABLE 1. Monitored Tolerance Table

Reset Threshold	Supply Voltage		
	2.5V	3.3V	5.0V
4.63 ± %			90.8-94.4%
3.08 ± %		91.8-95.2%	
2.32 ± %	90.8-94.8%		

Ensuring a Valid Reset Output Down to V_{CC} = 0V

When V_{CC} falls below 1V, the LM3722 $\overline{\text{RESET}}$ output is unable to sink the rated current. A high-impedance CMOS logic input connected to $\overline{\text{RESET}}$ can therefore drift to undetermined voltages. To prevent this situation, a 100kΩ resistor should be connected from the $\overline{\text{RESET}}$ output to ground, as shown in *Figure 1*.

A 100kΩ pull-up resistor to V_{CC} is also recommended for the LM3723, if RESET is required to remain valid for V_{CC} < 1V.

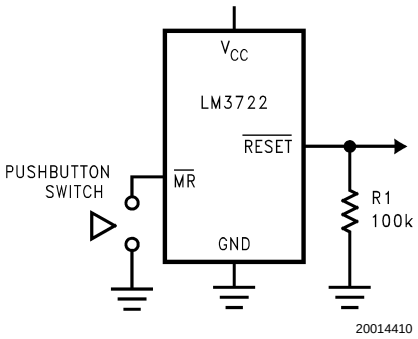

FIGURE 1. Circuit for $\overline{\text{RESET}}$ Valid from V_{CC} = 0V

Open Drain Output (LM3724)

An open drain output allows easy paralleling of multiple microprocessor reset circuits without requiring additional logic gates. Open drain outputs also allow interfacing devices of differing logic levels or families, since the output pull-up resistor may be connected to any supply voltage up to 5.5V, regardless of LM3724 V_{CC}.

The pull up resistor is calculated so that maximum current flow into $\overline{\text{RESET}}$ is less than 10 mA when activated. The resistor must be small enough so that the leakage current of all connected devices does not create an excessive voltage drop when the output is not activated. A resistor value of 100 kΩ will generally suffice.

Negative-Going V_{CC} Transients

The LM3722/LM3723/LM3724 are relatively immune to short negative-going transients or glitches on V_{CC}. *Figure 2* shows the maximum pulse width a negative-going V_{CC} transient can have without causing a reset pulse. In general, as the magnitude of the transient increases, going further below the threshold, the maximum allowable pulse width decreases. Typically, a V_{CC} transient that goes 125 mV below the reset threshold and lasts 40 µs or less will not cause a reset pulse. A 0.1 µF bypass capacitor mounted as close as possible to the V_{CC} pin will provide additional transient rejection.

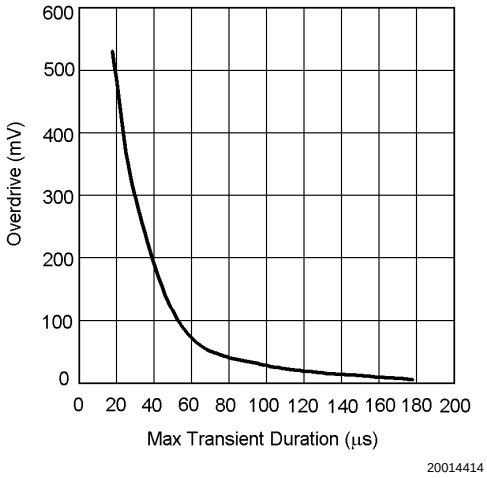

FIGURE 2. Maximum Transient Duration without Causing a Reset Pulse vs. Reset Comparator Overdrive

Interfacing to µPs with Bidirectional Reset Pins

Microprocessors with bidirectional reset pins, such as the Motorola 68HC11 series, can be connected to the LM3722 $\overline{\text{RESET}}$ output. To ensure a correct output on the LM3722 even when the microprocessor reset pin is in the opposite state, connect a 4.7kΩ resistor between the LM3722 $\overline{\text{RESET}}$ output and the µP reset pin, as shown in *Figure 3*. Buffer the LM3722 $\overline{\text{RESET}}$ output to other system components.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
