

# CAT3604

## 4-Channel Regulated Charge Pump White LED Driver

### FEATURES

- Drives individually up to 4 LEDs
- Output current up to 30mA per LED
- Digital control On/Off of each LED
- Compatible with supply voltage of 3V to 5.5V
- Power efficiency up to 93%
- 2 modes of operation 1x and 1.5x
- Automatic short circuit detect/disable
- High-frequency Operation at 1MHz
- Low value ceramic capacitors
- "604" compatible pinout
- Soft start and current limiting
- Thin QFN 16-lead package, 4x4mm, 0.8mm max height

### APPLICATIONS

- Color LCD and keypad Backlighting
- Cellular Phones
- Handheld Devices
- Digital Cameras
- PDAs
- Portable MP3 players

### DESCRIPTION

The CAT3604 is a charge pump operating in either 1x (LDO) mode or 1.5x fractional mode regulating current through each of the 4 LED pins. Operation at a fixed high frequency of 1MHz typical allows the use of very small value ceramic capacitors.

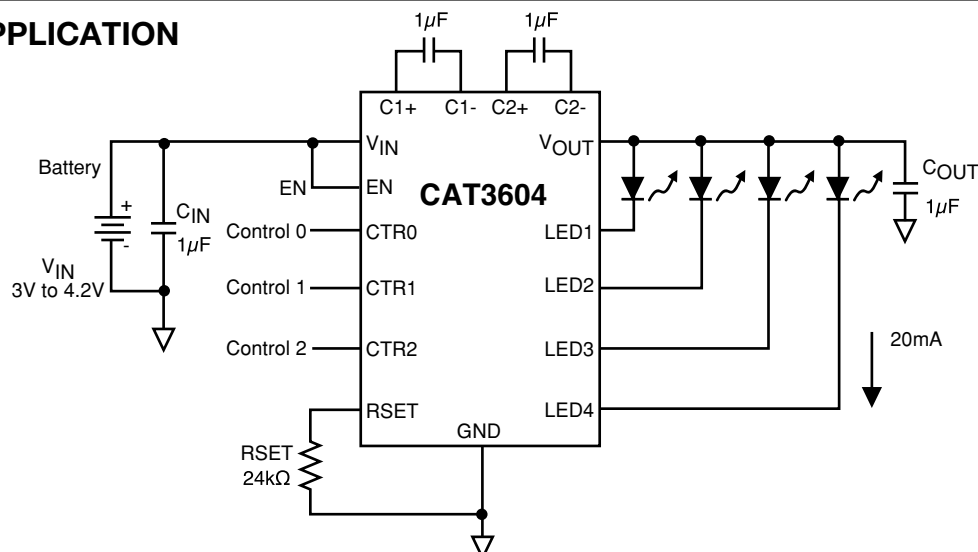

The CAT3604 drives white light-emitting diodes (LEDs) connected in parallel and provides tightly matched regulated current to achieve uniformity of brightness in LCD backlighting applications. An external resistor  $R_{SET}$  controls the output current level. LED currents of up to 30mA are supported over a range of input supply voltages from 3V to

5.5V, making the device ideal for battery-powered applications.

LED dimming can be accomplished by several methods including using a DC voltage to set the  $R_{SET}$  pin current, applying a PWM signal on the Control signals, or adding a switched resistor in parallel with  $R_{SET}$ . The Enable input pin allows the device to be placed in power-down mode with "zero" quiescent current.

The CAT3604 features short circuit and overcurrent limiting protection. The device is available in a 16-lead thin QFN package with a max height of 0.8mm.

## BLOCK DIAGRAM

## BASIC OPERATION

At power-up, the CAT3604 starts operation in 1x mode. If it is able to drive the programmed LED current, it continues in 1x mode. If the battery voltage drops to a level where the LED current cannot be met, the driver automatically switches into 1.5x mode. The 1.5x charge pump will boost the output voltage accordingly to achieve the nominal LED current.

The operating mode is reinitialized each and every time the chip is powered up or is taken out of shutdown mode (via EN pin). The use of the control pins (CTR0, CTR1, CTR2) does not reconfigure the mode of operation.

## LED CURRENT SETTING

The LED current is set by the external resistor  $R_{SET}$  connected between the RSET pin and ground. Table 1 lists various LED currents and the associated  $R_{SET}$  resistor value for standard 1% precision surface mount resistors.

LED Current (mA)	$R_{SET}$ (k $\Omega$ )
1	649
2	287
5	102
10	49.9
15	32.4
20	23.7
30	15.4

**Table 1. RSET Resistor Selection**

The digital control lines CTR0, CTR1 and CTR2 allow to turn On or Off a combination of LEDs as shown in Table 2.

Control Lines			LED Outputs			
CTR2	CTR1	CTR0	LED4	LED3	LED2	LED1
0	0	0	-	-	-	ON
0	0	1	-	-	ON	-
0	1	0	-	ON	-	-
0	1	1	ON	-	-	-
1	0	0	-	-	ON	ON
1	0	1	-	ON	ON	ON
1	1	0	ON	ON	ON	ON
1	1	1	-	-	-	-

Notes: 1 = logic high (or VIN)  
 0 = logic low (or GND)  
 - = LED output OFF

## SHORT CIRCUIT DETECT/DISABLE

The unused LED channels can also be turned off by connecting the respective LED pins to VOUT. In which case, the corresponding LED driver is disabled and the typical LED sink current is only about 20 $\mu$ A. When the following equation is true on any channel, the driver turns off the LED channel:

$$V_{OUT} - V_{LED} \leq 1V \text{ (LED channel OFF)}$$

Note: The CAT3604 is designed to drive LEDs with forward voltage greater than 1V and is not compatible with resistive loads.

## TYPICAL CHARACTERISTICS

## RECOMMENDED LAYOUT

When the driver is in the 1.5x charge pump mode, the 1MHz switching frequency operation requires to minimize trace length and impedance to ground on all 4 capacitors. A ground plane should cover the area on the bottom side of the PCB opposite to the IC and the bypass capacitors. Capacitors  $C_{in}$  and  $C_{out}$  require short connection to ground which can be done with multiple vias as shown on Figure 2. A

square copper area matches the QFN16 exposed pad (GND) which is connected by a trace to the pin 12 pad (GND). A large via (metalized hole) centered in the square pad provides a low impedance connection to the ground plane on the opposite side of the PCB and allows the heat dissipated by the driver IC to spread out resulting in excellent thermal performance.
