**DESCRIPTION:**

IDTCV115C is a 56 pin clock device, complying the latest Intel CK410 requirements, for Intel advance P4 processors. The CPU output buffer is designed to support up to 400MHz processor. One dedicated PLL for Serial ATA clock provides high accuracy frequency. This device also implements Band-gap referenced IREF to reduce the impact of VDD variation on differential outputs, which can provide more robust system performance.

Each CPU/SRC/PCI, SATA clock has its own Spread Spectrum selection, which allows for isolated changes instead of affecting other clock groups.

## PLL FREQUENCY PROGRAMMING PROCEDURES

The user changes PLL frequency through Soft Alarm or Hard Alarm. The Watch Dog circuit has to be enabled. Based on their application, the user may enable either one or both of the alarms.

User presets the CPU PLL Mode and N, and SRC PLL N value:

1. Set CPU PLL Mode, CB1 and CB2, byte 17
2. Set CPU PLL N, CN1 and CN2, byte 18 and byte 19
3. Set SRC (PCI Express) PLL N, PN1 and PN2, byte 21, 22

User selects the frequency for Soft Alarm and Hard Alarm, if enabled respectively:

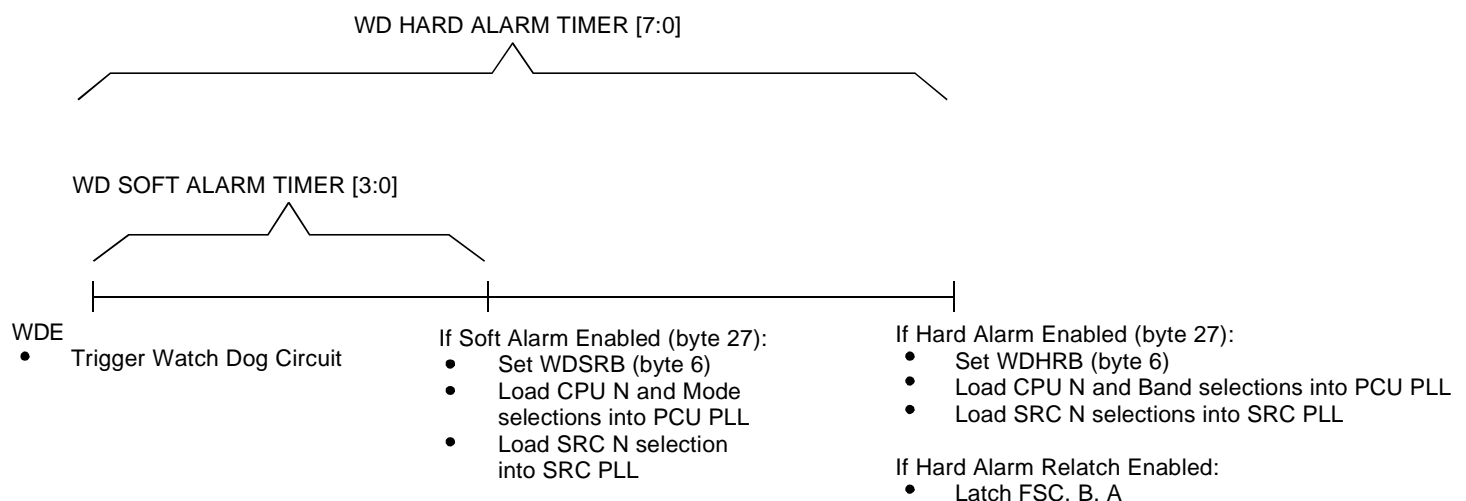

4. Select Soft Alarm frequency, byte 23
5. Select Hard Alarm frequency, byte 24

User sets the Timer and enables the WD circuit for frequency switch:

6. Set Hard Alarm Timer, byte 25
7. Set Soft Alarm Timer, byte 26
8. Enable Soft and Hard Alarm, byte 27
9. Enable Watch Dog (WDE), byte 27

- WDE Disable resets WDSRB and WDHRB.
- PCI CLK is selectable from SRC PLL or SATA PLL, byte 5 bit 6. If from SRC PLL, PCI frequency = 1/3 of SRC frequency. If from SATA, PCI is fixed to 3 selections, 33MHz, 36MHz and 40MHz, byte 5 bit[5:4].

## PD, POWER DOWN

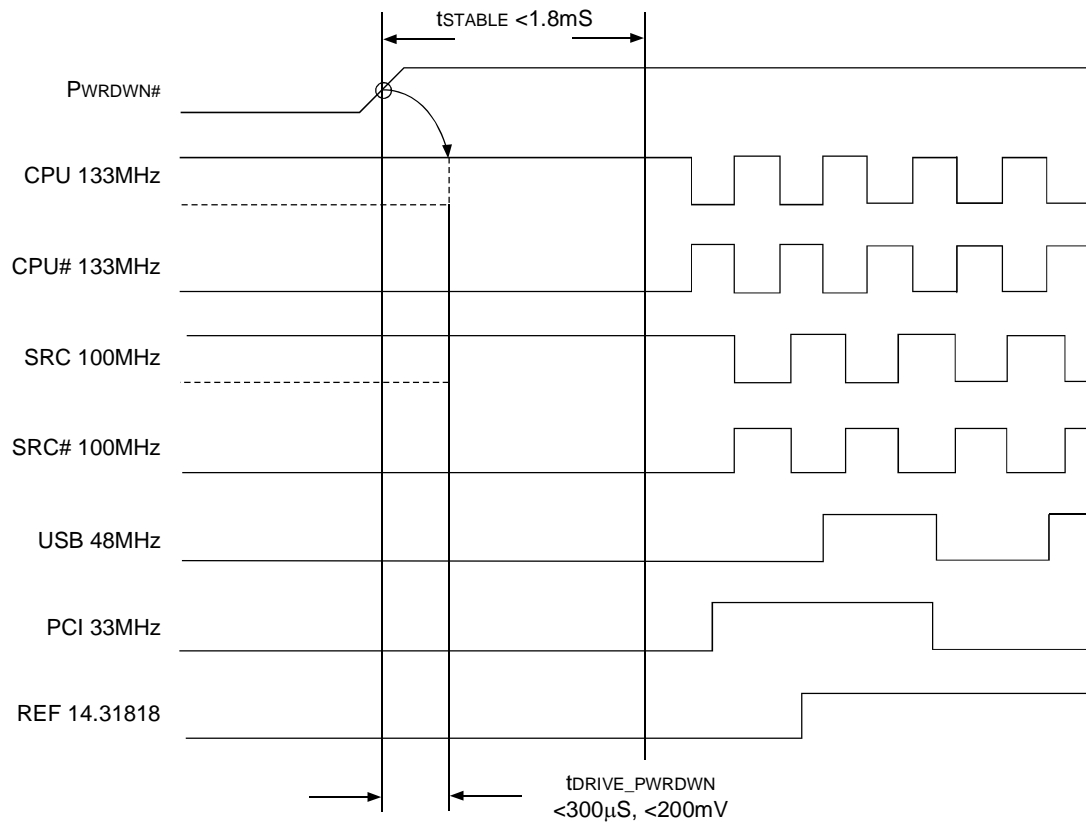

PD is an asynchronous active high input used to shut off all clocks cleanly prior to clock power. When PD is asserted high all clocks will be driven low before turning off the VCO. In PD de-assertion all clocks will start without glitches.
