DESCRIPTION:

The IDT71215 is a 245,760-bit Cache Tag StaticRAM, organized 16K x 15 and designed to support the Pentium and other Intel processors at bus speeds up to 66MHz. There are twelve common I/O TAG bits, with the remaining three bits used as status bits. A 12-bit comparator is on-chip to allow fast comparison of the twelve stored TAG bits and the current Tag input data. An active HIGH MATCH output is generated when these two groups of data are the same for a given address.

This high-speed MATCH signal, with tADM as fast as 8ns, provides the fastest possible enabling of secondary cache accesses.

The three separate I/O status bits (VLD, DTY, and WT) can be configured for either dedicated or generic functionality, depending on the SFUNC input pin. With SFUNC LOW, the status bits are defined and used internally by the device, allowing easier determination of the validity and use of the given Tag data. SFUNC HIGH releases the defined internal status bit usage and control, allowing the user to configure the status bit information to fit his system needs. A synchronous $\overline{\text{RESET}}$ pin, when held LOW at a rising clock edge, will reset all status bits in the array for easy invalidation of all Tag addresses.

The IDT71215 also provides the option for Burst Ready ($\overline{\text{BRDY}}$) generation within the cache tag itself, based upon MATCH, VLD bit, WT bit, and external inputs provided by the user. This can significantly simplify cache controller logic and minimize cache decision time. Match and Read operations are both asynchronous in order to provide the fastest access times possible, while Write operations are synchronous for ease of system timing.

The IDT71215 uses a 5V power supply on Vcc with separate VCCQ pins provided for the outputs to offer compliance with both 5.0V TTL and 3.3V LVTTTL Logic levels. The $\overline{\text{PWRDN}}$ pin offers a low-power standby mode to reduce power consumption by 90%, providing significant system power savings.

The IDT71215 is fabricated using IDT's high-performance, high-reliability BiCMOS technology and is offered in a space-saving 80-pin Thin Plastic Quad Flat Pack (TQFP) package.

NOTES:

1. This parameter is guaranteed with the AC Load (Figure 3) by device characterization, but is not production tested.
2. These parameters only apply when SFUNC is LOW and the internal WT bit is HIGH.
3. tADM, tDAM, tCSM and tADB, tDAB, tCSB must also be satisfied.
