KEMET also manufactures Ceramic Leaded, and Surface Mount Capacitors — Tantalum and Ceramic. Refer to Catalog F-3101 — Ceramic Leaded, and F-3102 — Surface Mount Capacitors for detailed information on these products. GR500 Tantalum High Reliability Capacitors are also available. Refer to Catalog E-2956

IMPORTANT NOTICE

KEMET Electronics Corporation disclaims all warranties, whether express, implied, or statutory as to any manner whatsoever, including the condition of the equipment, its compatibility with specific requirements, its merchantability, or fitness for any particular purpose which extend beyond the description on the face hereof.

Furthermore, under no circumstances shall KEMET Electronics Corporation be liable for consequential, special, incidental or indirect damages resulting from the use or handling of this product.

Finally, KEMET Electronics Corporation does not assume any responsibility for the correctness of the information contained in this catalog. All design characteristics, specifications, tolerances, and the like are subject to change without notice.

Established Reliability

STYLE

Tubular Case — Always Sleeved
 09 — Miniature — T222
 13 — Standard — T212
 21 — Standard, low ESR — T262
 23 — Extended Range — T242
 33 — Extended Range, Low Leakage — T252
 91 — Non-Polar — T213

VOLTAGE

GRADED

A — Not Applicable
 B — 0.1%/k hrs.
 C — 0.01%/k hrs.
 D — 0.001%/k hrs.

EXPONENTIAL

M — 1%/k
 P — 0.1%/k
 R — 0.01%/k
 S — 0.001%/k

CAPACITANCE TOLERANCE

J — ± 5%
 K — ± 10%
 M — ± 20%

CAPACITANCE

Expressed in picofarads (1 microfarad = 1,000 picofarads). First two digits represent significant figures. Last digit specifies the number of zeros to follow.

Examples

565 — 5,600,000 = 5.60 µF 563 — 56,000 = 0.56 µF
 564 — 560,000 = .56 µF

* This Military Part Numbering System is obsolete in accordance with current specifications. The correct current designation for a CSR number is the MIL Specification Number, followed by the Specification Sheet Number and Dash Number (i.e. — MIL-C-39003/01-2). However, the part number breakdown shown above is still widely used and is shown for reference.

Symbol	VDC Working		VDC Surge	
	85°C	125°C	85°C	125°C
B	6	4	8	5
C	10	7	13	9
D	15	10	20	12
E	20	13	26	16
F	35	23	46	28
G	50	33	65	40
H	75	50	98	64
J	100	67	130	86

MILITARY CAPACITOR APPROVED FAILURE RATE LEVELS AND MARKINGS PER MIL-C-39003 FOR CSR09 (T222 A & B CASE SIZES ONLY), CSR13 (T212), CSR21 (T262), CSR23 (T242) & CSR33 (T252) CAPACITORS

KEMET APPROVED FAILURE RATE LEVELS — MIL-C-39003/H (EXPONENTIAL)

STYLE	DESCRIPTION	KEMET SERIES	APPROVED FAILURE RATE LEVEL
CSR09	Polar-Subminiature	T222	S (0.001%/k hrs.)
CSR13	Polar-Standard MIL Range	T212	S (0.001%/k hrs.)
CSR21	Polar-Standard Low ESR MIL Range	T262	S (0.001%/k hrs.)
CSR23	Polar-Extended Range	T242	S (0.001%/k hrs.)

STYLE	DESCRIPTION	KEMET SERIES	APPROVED FAILURE RATE LEVEL
CSR33	Polar-Extended Range Low Leakage	T252	S (0.001%/k hrs.)
CSR91	Non-Polar	T213	S (0.001%/k hrs.)

MILITARY MARKING

A CASE

39003	— Military specification number
01 - K	— Specification sheet number and trademark
9002J	— Military dash number and "J" for JAN
+933	— Polarity, date code (1st digit indicates year and the next two digits indicate the week)
XY	— Lot symbol

C & D CASES

M39003	— Military specification number
01 - 8222J	— Specification sheet number, Military dash number, and "J" for JAN
+6.8 µF	— Positive terminal identifier and capacitance value
10% 50V	— Capacitance tolerance and voltage
31433	— Source code
9933 XY K	— Date code, lot code, and trademark

B CASE

M39003	— Military specification number
01 -	— Specification sheet number
8006J	— Military dash number and "J" for JAN
31433	— Source code
+933 XY	— Polarity, date code (1st digit indicates year and the next two digits indicate the week), lot symbol

CSR91 (T213) CAPACITORS A, B, C & D CASES

M39003	— Military specification number
04 - 0980J	— Specification sheet number, Military dash number, and "J" for JAN
1 µF	— Capacitance value
10% 20VNP	— Capacitance tolerance and voltage rating
9933 XY 31433	— Date code, lot code, and source code

(See page 38 for CSS Marking)

CSR09	Polar-Subminiature	T222	D (0.001%/k hrs.)
CSR13*	Polar-Standard MIL Case	T212	D (0.001%/k hrs.)
CSS13**	Polar-Standard MIL Case	T216	C (0.01%/k hrs.)
CSR21	Polar-Standard Low ESR MIL Case	T262	D (0.001%/k hrs.)
CSR23*	Polar-Extended Range	T242	D (0.001%/k hrs.)

*Not approved to 'D' Failure Rate Level on all voltages and capacitance values.
**MIL-C-39003/10 for space applications.

CSR33*	Polar-Extended Range Low Leakage	T252	D (0.001%/k hrs.)
CSS33**	Polar-Extended Range Low Leakage	T256	C (0.01%/k hrs.)
CSR91*	Non-Polar	T213	D (0.001%/k hrs.)

*Not approved to 'D' Failure Rate Level on all voltages and capacitance values.
**MIL-C-39003/10 for space applications.

PERFORMANCE CHARACTERISTICS

- **CAPACITANCE/VOLTAGE RANGE:** .0023-1200 μ F, 6-125 Volts.
- **CAPACITANCE TOLERANCE:** Available in standard EIA values with $\pm 20\%$, $\pm 10\%$ and $\pm 5\%$ tolerances.
- **DISSIPATION FACTOR:** Maximum DF limits are shown in corresponding series part number listings on pages 7-41. See Application Notes Section, page 76 for additional description.
- **DC LEAKAGE CURRENT:** Each corresponding part number table lists maximum leakage current for each capacitor on pages 7-41. See Application Notes Section, page 76 for additional description.
- **RATED VOLTAGE; WORKING VOLTAGE; SURGE VOLTAGE; REVERSE VOLTAGE:** See Application Notes Section, Pages 76 & 77 for description.
- **IMPEDANCE and ESR:** See Application Notes Section, pages 77 & 78 for description. Reference ESR values are shown for commercial hermetically sealed capacitors on page 19.

- **AC RIPPLE VOLTAGE:** Permissible AC ripple voltage is related to the ESR of the capacitor and power dissipation capabilities of a particular case size. Thermal capacities for the various case sizes have been determined empirically and are listed below. For additional description see page 78.

Standard Case Size	Watts	T222
A	.09	.070
B	.100	.090
C	.125	—
D	.180	—

Maximum Power Dissipation: 25°C Ambient

- **ENVIRONMENTAL CONSIDERATIONS:**
 - A. Shock Test: MIL-STD-202, Method 213
 - B. Thermal Shock, MIL-STD-202, Method 107, Condition B.
 - C. Moisture Resistance: MIL-STD-202, Method 106.
 - D. Solderability: MIL-STD-202, Method 208

For additional Environmental Test Information see pages 80, 81 and 82.

- **LEAD MATERIAL:** Standard leads are solder-coated nickel per MIL-STD-1276.
- **INSULATING SLEEVES:** The standard insulating material used in transparent high temperature plastic, having 2000 volt dielectric strength, excellent dimensional stability and chemical and flow resistance.
- **LEAD TAPE and REEL:** Reeling per specification RS-296. See pages 71 and 73 for additional information.

ORDERING INFORMATION*

MARKING INFORMATION

Marking: Unless otherwise specified by special order, standard marking of T110 Series capacitor consists of the following:

A, B, C & D CASES

+K 10%	— Polarity, Manufacturer's Identification and Capacitance Tol.
R56 μF	— Normal Capacitance — (μF) ("R" indicates decimal)
100V	— Voltage
9912XY	— Date Code (e.g.: 9912XY)

* For Military Marking, see page 4.

(1) To complete T110 Series Part Number, insert Capacitance Tolerance Symbol in the 9th Character as shown on Page 6.

(2) To complete the T212 Series Part Number, insert Failure Rate Symbol in the 13th Character.

Bold Face lines indicate popular part types and values.

(1) To complete T110 Series part number, insert Capacitance Tolerance Symbol in the 9th Character as shown on Page 6.

(2) To complete the T212 Series Part Number, insert Failure Rate Symbol in the 13th Character.
Bold Face lines indicate popular part type and values.

(1) To complete T110 Series Part Number, insert Capacitance Tolerance Symbol in the 9th Character as shown on Page 6.

(2) To complete the T212 Series Part Number, insert Failure Rate Symbol in the 13th Character.

Bold Face lines indicate popular part types and values.

*Note: D Failure Rate — Not QPL for -8304 thru -8401.

ORDERING INFORMATION

CSR09 CAPACITOR MARKINGS PER MIL-C-39003

39003	— Military specification number
02 - K	— Specification sheet number and trademark
2961J	— Nonsignificant dash number and "J" for JAN
+933	— Polarity, date code (1st digit indicates year and the next two digits indicate the week)
XX	— and lot symbol

(1) To complete T140 Series Part Number, insert Capacitance Tolerance Symbol in the 9th Character as shown on Page 6.

(2) To complete the T242 Series Part Number, insert Failure Rate Symbol in the 13th Character.

Bold Face lines indicate popular part types and values.

For ordering information, see page 4 (Military) and Page 6.

(1) To complete the T262 Series Part Number, insert Failure Rate Symbol in the 13th Character as shown on Page 34.

These capacitors provide circuit designers an excellent choice for blocking, bypass, decoupling, filtering and timing applications.

ORDERING INFORMATION

*Part Number Example: T216A105K050CS (14 digits – no spaces)

MARKING INFORMATION

A CASE

39003	— Military specification number
10 - K	— Specification sheet number and trademark
3078S	— Military dash number and "S" for sleeved
+J910	— Polarity, "J" for JAN date code (1st digit indicates year and the next two digits indicate the week)
XYA	— Lot, unique lot code

C & D CASE

M39003	— Military specification number
10-2049SJ	— Specification sheet number, military dash number and "J" for Jan.
+6.8 μF	— Positive terminal identifier and capacitance value
10% 35V	— Capacitance tolerance and voltage rating
31433	— Source code
9910 NAB K	— Date code, lot code, unique lot code, and trademark

B CASE

M39003	— Military specification number
10 -	— Specification sheet number
3082SJ	— Military dash number and "J" for JAN
31433	— Source code
+910	— Polarity, date code (1st digit indicates year and the next two digits indicate the week)
NABK	— Lot code, unique lot code and trademark.

NOTE: Marking will include S or U after the MIL dash number. The third letter following lot symbol or lot code designates a unique terminal identifier, and a black band on negative end of case.

■ Black band on negative end.

KEMET Electronics Corporation, P.O. Box 5928, Greenville, S.C. 29606 (864) 963-6300

Supplied in six axial lead tubular case sizes, these capacitors are ideally suited for use in printed wiring boards and all applications requiring a high degree of packaging density and can be supplied in bulk packaging or lead-taped on reels.

The T322/T323 Series dimensions and tight lead wire-to-body concentricity permit installation by the same automatic insertion equipment used for diodes and resistors. Available in working voltages of

T323 Series capacitors are qualified under MIL-C-49137/1 & Military Style CX01 & CX05.

Typical applications include decoupling, blocking, bypassing and filtering in commercial computers, data processing, communication and other electronic equipment. The low ESR/impedance at high frequencies offered by this capacitor is especially suitable for applications required by high speed computers.

PERFORMANCE CHARACTERISTICS

- **CAPACITANCE/VOLTAGE RANGE:**
0.1-330 μ F, 2-50 Volts.
- **CAPACITANCE TOLERANCE:** Available in standard EIA nominal values with $\pm 20\%$, $\pm 10\%$ and $\pm 5\%$ tolerance.
- **DISSIPATION FACTOR:** Maximum DF limits are shown in corresponding series part number listings on pages 44-48. See Application Notes Section, page 76 for additional description.
- **DC LEAKAGE CURRENT:** Each corresponding part number table lists maximum leakage current for each capacitor on pages 44 through 48. See Application Notes Section, page 76 for additional description.
- **RATED VOLTAGE; WORKING VOLTAGE; SURGE VOLTAGE; REVERSE VOLTAGE:** See Application Notes Section, page 76 & 77 for description.
- **AC RIPPLE VOLTAGE:** Permissible AC ripple voltage is related to equivalent series resistance (ESR) and power dissipation capability. Maximum power dissipation for each case size is listed in Table below. For additional description see page 79.

Case Size	Power Dissipation (max.) @ 25°C (watts)
A	.060
B	.070
C	.080
D	.090
E	.100
F	.110

Maximum Power Dissipation Capability @ 25°C

- **IMPEDANCE and ESR:** See Application Notes Section, pages 77 & 78 for description. Reference ESR values are shown in adjoining column, this page.
- **ENVIRONMENTAL CONSIDERATIONS:**
 - Shock Test: MIL-STD-202, Method 213.
 - Thermal Shock, MIL-STD-202, Method 107.
 - Moisture Resistance: MIL-STD-202, Method 106.
 - Solderability: MIL-STD-202, Method 208.

T322 ESR (OHMS) at 100 kHz @ +25°C
(The ESR values provided below are for reference only. No warranty, as stated on page 3 and reincorporated here, is made as to the accuracy of these values for any particular T322 Series product)

For additional Environmental Test Information see pages 80, 81 and 82.

- **LEAD MATERIAL:** Solder coated steel core with copper plating per MIL-STD-1276.
- **LEAD TAPE and REEL:** Reeling per specification RS-296. See pages 71 and 73 for additional information.

DIMENSIONS — INCHES & (MILLIMETERS)

CASE SIZE	D (MAX)	L (MAX)	W
A	.095 (2.41)	.260 (6.6)	.020 (.51)
B	.110 (2.79)	.290 (7.37)	.020 (.51)
C	.180 (4.57)	.345 (8.76)	.020 (.51)
D	.180 (4.57)	.420 (10.67)	.020 (.51)

T322 & T323 ORDERING INFORMATION

T 32X A 474 M 035 A S — C*

TANTALUM — T

SERIES — 32X
Sub-Miniature, Molded, Polar, Solid Tantalum,
Insert appropriate number to replace
letter "X" — 322 or 323 (CX01, CX05).

CASE SIZE — A
A, B, C, D, E, or F

CAPACITANCE IN PICOFARADS — 474
First two digits are significant figures.
Third digit is number of zeros following.

SPECIFICATION (when necessary) — C*
— Reeling Per EIA
Specification RS-296

LEAD MATERIAL — S
S — Standard

FAILURE RATE LEVEL — A
A — Not Applicable

VOLTAGE RATING — 035

CAPACITANCE TOLERANCE — M
*M — ±20%
*K — ±10%
*J — ±5%

***Part Number Example: T322A474M035AS (14 digits – no spaces)**

* M & K only tolerances available for T323 Series.

MIL-C-49137/5 MILITARY ORDERING INFORMATION

CX 05 D 225 K

TYPE — CX
Capacitor, Fixed, Solid Tantalum,
Molded, Non-hermetically Sealed

STYLE — 05
01, 05 (T323) A, B, C, and D

VOLTAGE — D

CAPACITANCE TOLERANCE — K

Symbol	Capacitance Tolerance Percent (±)
K	10
M	20

CAPACITANCE TOLERANCE
The nominal capacitance value, expressed in picofarads (pF), is identified by a three-digit number; the first two digits represent significant figures and the last digit specifies the number of zeros to follow.

Symbol	Rated (85°C) Volts, DC	Surge (85°C) Volts, DC
D	6	8.0
F	10	13.0
H	15	20.0
J	20	26.0
K	25	32.0
M	35	46.0
N	50	65.0

CAPACITOR MARKING

(1) To complete KEMET Part Number, insert Capacitance Tolerance Symbol as follows: M — ±20%, K — ±10%, J — ±5%
Bold Face lines indicate preferred part types and values.

T330 Series capacitors provide superior packing factor and space utilization compared with tubular units of the same microcoulomb (CV) rating.

T330 Series capacitors employ a rectangular sintered, dry tantalum anode, transfer molded in precision dies with a high impact resistant plastic having excellent electrical, physical, and moisture resistant properties. All cases utilize gold color plastic which permits laser marking with outstanding permanency and legibility. The polarity is indicated by a + sign permanently marked on the case. The radius on the two vertical edges at the positive end of B, C, and D Cases can be used as a sensing dimension for automatic insertion processes.

T340 Series

The compact space saving T340 Series is transfer molded in precision dies with a high impact resistant plastic having excellent electrical, physical, and moisture resistant properties. The gold color plastic case utilized permits laser marking with outstanding permanency and legibility.

Marking is provided on the top of the case to allow visual inspection for proper polarity and placement after insertion. In addition, positive polarity identification is achieved by an easily recognized molded radius on the positive end of the case. This physical polarity identification is readily observed after capacitor placement as a further aid to the top marking in prevention of possible reverse insertion.

PERFORMANCE CHARACTERISTICS

- **CAPACITANCE/VOLTAGE RANGE:**
T330: 0.1-220 μ F, 6-50 Volts.
T340: 0.1-330 μ F, 6-50 Volts.
- **CAPACITANCE TOLERANCE:** Available in standard EIA nominal values with $\pm 20\%$ tolerance standard, $\pm 10\%$ and $\pm 5\%$ available on special order.
- **DISSIPATION FACTOR:** Maximum DF limits are shown in corresponding series part number listing. See Application Notes Section, page 78.
- **DC LEAKAGE CURRENT:** Maximum leakage values at 25°C are shown in part number listings, pages 51, 52, 55, 56 and 57. See Application Notes Section, page 76.

T330/T340 ESR (OHMS) at 100 kHz @ +25°C

(The ESR values provided below are for reference only.
No warranty, as stated on page 3 and reincorporated here, is made as to the accuracy of these values for any particular T330/T340 Series product.)

T330 Series capacitors are highly reliable and exhibit performance characteristics typical of military test standards. They are available in capacitance values ranging from 0.1 to 220 microfarads in $\pm 10\%$, $\pm 5\%$ tolerance levels, and in working voltages from 6 to 50 volts. At 85°C the capacitors will operate continuously at full working voltage. They are rated to 125°C when operated at 2/3 of nameplate voltage. In addition, they feature exceptionally low DC leakage current and Dissipation Factor characteristics.

They are ideal for bypass, coupling, and timing applications in computers, military ordinance, industrial, entertainment, and consumer electronic equipment.

Standoffs, located in the base of all case sizes, provide vents for air circulation and also allow easy removal of flux residues from wire and circuit board solder joints. With very low impedance and ESR values, the T340 Series features exceptionally low DC leakage current and DF characteristics. The T340 Series is available in standard $\pm 20\%$; $\pm 10\%$; $\pm 5\%$ (special order) capacitance tolerance.

T340 Series capacitors are highly reliable and exhibit performance characteristics typical of military test standards.

- **RATED VOLTAGE; WORKING VOLTAGE; SURGE VOLTAGE; REVERSE VOLTAGE:** See Application Notes Section, pages 77 for description.
- **IMPEDANCE and ESR:** See Application Notes Section, pages 77 & 78 for additional information. Reference ESR values are shown in table below.
- **AC RIPPLE VOLTAGE:** Permissible AC ripple voltage is related to the ESR of the capacitor and the power dissipation capabilities of a particular case size. Thermal capacities for the various case sizes have been determined and are listed in Table below. For additional description see page 78.

Series	Case Size	Watts
T330/T340	A	.09
	B	.09
	C	.100
T330	D	.125
T340 only	D/F	.125
	E	.180

Maximum Power Dissipation: 25°C Ambient

- **ENVIRONMENTAL CONSIDERATIONS:**
 - Shock Test: MIL-STD-202, Method 213.
 - Thermal Shock, MIL-STD-202, Method 107.
 - Moisture Resistance: MIL-STD-202, Method 106.
 - Solderability: MIL-STD-202, Method 208.

For additional Environmental Test Information see pages 80 and 82.
- **LEAD MATERIAL:** Solder coated steel core with copper plating. See MIL-STD-1276.
- **LEAD TAPE and REEL:** Reeling per specification RS-468, pages 71 and 73 for additional information.

(1) To complete Part Number insert Capacitance Tolerance Symbol in the 9th character, M — ±20%, K — ±10%, J — ±5%.

Bold face lines indicate popular part types and values.

Higher voltage and better capacitance tolerance product may be substituted for an order within the same case size at KEMET'S option.

DIMENSIONS — INCHES & MILLIMETERS

CASE SIZE	H** (MAX)		W (MAX)		T (MAX)		LEAD SPACING S		LEAD LENGTH L		LEAD DIAMETER D	
	H		W		T		Inches	mm	Inches	mm	Inches	mm

(1) To complete KEMET Part Number, insert M — ±20%, K — ±10%, or J — ±5% for capacitance tolerance as shown in T340 ordering information.

(2) To complete KEMET Part Number, insert letter "C" for 5.0 mm (.197") lead spacing, "D" for 10.0 mm (.394") lead spacing, "E" for 10.0 mm (.394") lead spacing or letter "F" for 5.0 mm (.197") lead spacing. See page 53 for outline drawings.

Bold face lines indicate popular part types and values.

Higher voltage and better capacitance tolerance product may be substituted for an order within the same case size at KEMET'S option.

itary styles CX06 (T378 Series).

The KEMET T370 Series is encapsulated in a molded gold color epoxy. This encasement technique allows maximum utilization of circuit board real estate with precisely centered leads in a microminature case.

marking system ensures legibility and permanency while offering complete alphanumeric print format. Laser print meets all requirements of the Resistance to Solvents Test, method 213 MIL-STD-202.

PERFORMANCE CHARACTERISTICS

- **CAPACITANCE/VOLTAGE RANGE:**
T370 Series: 0.68-220 μ F, 3-35 Volts.
T378 Series: 2.2-220 μ F, 3-35 Volts.
- **CAPACITANCE TOLERANCE:** Available in standard EIA nominal values with $\pm 20\%$ tolerance standard, +40% -20%, $\pm 10\%$ and $\pm 5\%$ are also available.
- **DISSIPATION FACTOR:** Maximum DF limits are shown in corresponding series part number listings on page 60. See Application Notes Section, page 76 for additional information.
- **DC LEAKAGE CURRENT:** Maximum leakage values at 25° are shown in part number listings, page 60. See Application Notes Section, page 76 for additional information.
- **RATED VOLTAGE; WORKING VOLTAGE; SURGE VOLTAGE; REVERSE VOLTAGE:** See Application Notes Section, pages 76 & 77 for description.
- **IMPEDANCE and ESR:** See Application Notes Section, pages 78 for description. Reference ESR values are listed in table below.
- **AC RIPPLE VOLTAGE:** Permissible AC ripple volt-

T370 ESR (OHMS) at 100 kHz @ +25°C
(The ESR values provided below are for reference only. No warranty, as stated on page 3 and reincorporated here, is made as to the accuracy of these values for any particular T370 Series product.)

Cap. μ F	6 Volt	10 Volt	15 Volt	20 Volt	25 Volt	35 Volt

150.0	0.9					

age is related to the ESR of the capacitor and power dissipation capabilities of a particular case size. Thermal capacities for the various case sizes have been determined and are listed in Table below. For additional description see page 78.

- **ENVIRONMENTAL CONSIDERATIONS:**

Case Size	Watts
C	.070
D	.080
E	.090
F	.100

Maximum Power Dissipation Capability @ 25°C

- A. Shock Test: MIL-STD-202, Method 213 Condition 1.
 - B. Thermal Shock, MIL-STD-202, Method 107
 - C. Moisture Resistance: MIL-STD-202, Method 106.
 - D. Solderability: MIL-STD-202, Method 208.
- For additional Environmental Test Information see pages 80, 81 and 82.
- **LEAD MATERIAL:** Solder coated nickel MIL-STD1266, type N32.
 - **LEAD TAPE and REEL:** Reeling per specification RS-468. See pages 72 and 74 for additional information.

CAPACITANCE
 The nominal capacitance value, expressed in picofarads (pF), is identified by a three digit number. The first two digits represent significant figures and the last digit specifies the number of zeros to follow.

KEMET Electronics Corporation, P.O. Box 5928, Greenville, S.C. 29606 (864) 963-6300

(1) To complete KEMET part number, insert capacitance tolerance symbol as follows: L = $\pm 40\%$, -20%; M = $\pm 20\%$; K = $\pm 10\%$; J = $\pm 5\%$.

(2) To complete military part number, insert capacitance tolerance symbol as follows: M = $\pm 20\%$; K = $\pm 10\%$.

(3) To complete KEMET part number, insert capacitance tolerance symbol as follows: M = $\pm 20\%$; K = $\pm 10\%$.

- **CAPACITANCE TOLERANCE:** Available in standard EIA nominal values with $\pm 20\%$ and $\pm 10\%$ standard.
- **DISSIPATION FACTOR:** Maximum DF limits are shown in corresponding series part number listings. See Application Notes Section, page 76 for additional information.
- **DC LEAKAGE CURRENT:** Maximum leakage values at 25° are shown in part number listings, pages 63-65, 67, 68 and 70. See Application Notes Section, pages 76 & 77 for additional information.
- **RATED VOLTAGE; WORKING VOLTAGE; SURGE VOLTAGE; REVERSE VOLTAGE:** See Application Notes Section, pages 76 & 77 for description.
- **IMPEDANCE and ESR:** See Application Notes Section, page 77 & 78 for description. Reference ESR values are shown in table below.

Commercial T35X/T36X/T39X ESR (OHMS) at 100 kHz @ +25°C
 (The ESR values provided below are for reference only. No warranty, as stated on page 3 and reincorporated here, is made as to the accuracy of these values for any particular T35X, T36X, T39X Series product.)

Maximum Power Dissipation Capability @ 25°C

- **ENVIRONMENTAL CONSIDERATIONS:**
 - A. Shock Test: MIL-STD-202, Method 213.
 - B. Thermal Shock, MIL-STD-202, Method 107 Condition A.
 - C. Moisture Resistance: MIL-STD-202, Method 106.
 - D. Solderability: MIL-STD-202, Method 208.
 For additional Environmental Test Information see pages 80, 81 and 82.
- **LEAD MATERIAL:** Solder coated steel core copper ply per MIL-STD-127.
- **LEAD TAPE and REEL:** Reeling per specification RS-468. See pages 72 - 74 for additional information.

provide the designer with the advantage of compactness plus low leakage and low DF performance characteristics for filtering, bypassing, coupling, blocking and RC timing circuits. This series features a capacitance range from 0.1 to 680 microfarads at voltages from 3 to 50 VDC. 'UltraDip II' capacitors utilize the same sophisticated materials and processes which have advanced KEMET Electronics Corporation to the leadership position in solid tantalum capacitors.

Solid tantalum devices exhibit no degradation failure mode shelf storage and show a constantly decreasing failure rate (absence of wearout mechanism) during life tests.

The 'UltraDip II' Series provides self-insulating cases which resistant to shock and vibration. These capacitors exhibit low ESR and Impedance and have excellent temperature stability.

CAPACITANCE IN PICORARAD CODE

The nominal capacitance value, expressed in picofarads (pF), is identified by a three-digit number. The first two digits represent significant figures and the last digit specifies the number of zeros to the right of the decimal point.

*For KEMET Ordering Information, see page 63.

(1) To complete KEMET part number, insert capacitance tolerance K- ±10%, M- ±15% or J- ±5% (Available on special order).

*** For Marking Information refer to page 63.**

*** For Ordering Information refer to page 63.**

The UltraDip III Series features a capacitance range of 0.1 to 680 μF at 3 to 50 VDC. These miniature dipped solid tantalum capacitors are encased in a tough plastic barrier coating that maintains the pre-

These capacitors may be ordered with precut leads (see drawing lengths) or in KEMET Capacitor ARIS packaging (leads taped on reels) for high speed automatic insertion equipment.

Table 1 Dimensions in Inches & (Millimeters)

COMPONENT BODY DIAMETER	COMPONENT PITCH "A"	INSIDE TAPE SPACING "B" ±1.5mm (0.059")		
		I	II	III
0" (0mm) to 0.197" (5mm)	0.200" or (5mm)	2.062"	2.500"	2.874"
0.197" (5.01mm) to 0.394" (10mm)	0.400" or (10mm)	(52.4mm)	(63.5mm)	(73mm)

Capacitors are reeled so that positive leads are oriented as shown in Figure 3. Kraft paper (50lb. test minimum) is inserted between the layers of capacitors wound on reels for component pitch ≤ 0.200 " sizes and corrugated paper (70 lb. test minimum), single faced is inserted for component pitch ≥ 0.400 " sizes. Capacitor lead length extend only a maximum of .031" (0.8 mm) beyond the tape's edges. Capacitors are centered in a row between two tapes and will deviate only ± 0.031 " (0.79 mm) from the row center. Figures 1 and 2 show the KEMET standard chipboard tape reel. A minimum of 36" (91.5 cm) leader tape is provided at each end of the reeled capacitor. Universal splicing clips are used to connect the tape. Standard reel quantities are shown on page 73.

its on dimensions and certain electrical characteristics under standard conditions of 25°C, 50% relative humidity, and one atmosphere pressure. Specific requirements are set forth in the respective Product Series in this catalog. All Military products are 100% electrically screened for the parameters shown in the respective product section. For non-military product, all series are 100% screened for leakage, capacitance and dissipation factor. All Series are inspected to electrical limits using a minimum .1% AQL sampling plans, according to the Military Standard MIL-STD-105, even after 100% testing. This sampling plan, to the best of KEMET Electronics' knowledge, meets or exceeds the generally accepted industry standard for similar products. KEMET capacitors may also be supplied, with prior agreement, to meet specifications with requirements differing from those of KEMET catalogs. **Reference ESR values are provided but are NOT 100% screened**

These Notes apply generally to all KEMET solid tantalum capacitors and illustrate typical performance under normal application conditions, except where noted. Certain Series will respond differently to various environmental conditions. For example, hermetically sealed series are relatively immune to humidity effects, while plastic-encased series are not. The intent of these Notes is not to delineate such differences but to provide generalized information concerning performance characteristics.

1. GENERAL APPLICATION CLASS

Solid tantalum capacitors are usually applied in circuits where the AC component is small compared to the DC component. Typical uses known to KEMET Electronics include blocking, by-passing, decoupling, and filtering. They are also used in timing circuits. If two of these polar capacitors are connected "back-to-back" (i.e., negative-to-negative or positive-to-positive), the pair may be used in AC applications (as a non-polar device).

2. STORAGE CONDITIONS

Capacitors may be stored without applied voltage over the operating temperature range specified in the catalogs for each Series. The range is from -55 to +125° C for all Series.

Tantalum capacitors do not lose capacitance from the "de-forming" effect as do liquid-electrolytic capacitors. Storage at high temperature may cause a small, temporary increase in leakage current (measured under standard conditions), but the original value is usually restored within a few minutes after application of rated voltage.

Series which are not hermetically sealed exhibit reversible changes in parameters with respect to relative humidity (RH). Capacitance increases with increasing humidity. The limiting change, reached upon establishment of equilibrium with the environment, is approximately -5% to +12% over the range from 25% to 95% RH, referred to the standard 50% RH. The amount of change is dependent upon size (capacitance and voltage rating, ie: CV product); small sizes might change no more than ±5%. Equilibrium at such extremes is seldom attained by plastic-cased capacitors, and the change in capacitance is consequently less. The rate of response to humidity changes increases with increasing temperature.

normally restored by voltage conditioning under standard conditions. The increase will be greater than that experienced under temperature influence alone because of reduction through absorbed water.

Hermetically-sealed and non-hermetic Series may be affected by absorption of water on external insulating faces. The water film may also attract a layer of dust in the air, increasing the effect. The most sensitive parameter is leakage current.

3. POLARITY

These capacitors are inherently polar devices and may be permanently damaged or destroyed if connected with the wrong polarity. The positive terminal is identified on the capacitor body by a polarity mark and the capacitor body may include an obvious geometrical shape. However, some Series contain two capacitors connected (negative-to-negative) to form "non-polar" capacitors. Rated voltage (see para. 8) may be applied to the Series in either direction.

4. OPERATING ENVIRONMENT

Most of the discussion under "Storage Conditions" will apply also when capacitors are operated within applicable electrical ratings described below. The temporary increase in leakage current (at standard conditions) following elevated-temperature exposure is not observed, however, if the capacitors are operated with adequate voltage applied.

5. CAPACITANCE

Capacitance is measured at 120 Hz and 25° C up to 1 volt rms applied. Note that, in either operation peak AC plus DC bias must not exceed either rated voltage (normally polarized) or 15% of rated voltage in reverse direction at 25°C. Measurement circuits are at high impedance, however, and under these conditions 1 volt rms may be applied even to 6 volt capacitors (peak reversal) without a DC bias. DC bias is thus normally not used, except when rated voltage is below 6 volts. The AC signal level exceeds 0.3 vrms. However, MIL-C-39003 provides for up to 2.2 volts DC.

DC bias causes a small reduction in capacitance to about 2% when full rated voltage is applied as bias. It is also reduced by the presence of DC; rated voltage cause a decrease in DF of about 0.2% (e.g., a decrease from 3.6 to 3.4% DF).

Capacitance changes very little below 1 kHz and decreases more noticeably at higher frequencies. Large capacitance values decline more rapidly than small ratings. The effect of frequency upon capacitance is shown in Figure 1.

Figure 1. Normal Effect of Frequency upon Capacitance

Figure 2. Typical Effect of Temperature upon Capacitance

6. DISSIPATION FACTOR (DF)

DF is measured at 120 Hz and 25° C with up to 1 volt rms applied. Note that, in either operation, peak AC plus DC bias must not exceed either rated voltage (normally polarized) or 15% of rated voltage in the reverse direction at 25°C. Measurement circuits are of high impedance, however, and under these conditions 1 volt rms may be applied even to 6 volt capacitors (23% peak reversal) without a DC bias. DC bias is thus normally not used, except when rated voltage is below 6 volts and the AC signal level exceeds 0.3 vrms. However, MIL-C-39003 provides for up to 2.2 volts DC.

Dissipation Factor (DF) is a useful low-frequency measure of the resistive component in capacitors. It is the ratio of the unavoidable resistance to the capacitive reactance, usually expressed in percent. DF increases with temperature above +25° C and may also increase at lower temperatures. Unfortunately, one general limit for DF cannot be specified for all capacitance/voltage combinations, nor can response to temperature be simply stated. Catalogs for the respective series list DF limits under various conditions.

Dissipation factor increases with increasing frequency as would be expected from the decreasing capacitive reactance. DF is not a very useful parameter above about 1 kHz. The DF of larger capacitance values increases more rapidly than that of smaller ratings. Figure 3 shows typical effect of frequency on DF.

Figure 3. Normal Effect of Frequency upon Dissipation Factor

DC bias causes a small reduction in capacitance, up to about 2% when full rated voltage is applied, as bias. DF is also reduced by the presence of DC bias. Rated voltage may cause a decrease in DF of about 0.2% (e.g., a decrease from 3.6 to 3.4% DF).

DF is defined as $\frac{ESR}{\chi_c}$ and is also referred to occasionally, as $\tan d$ or "loss tangent." The "Quality Factor," Q, is the reciprocal of DF (DF is not expressed in

DC LEAKAGE (DCL) is affected by voltage to a much larger extent, and this effect can frequently be used to advantage in circuits where only very low leakage currents can be tolerated. Typical response of DCL to applied voltage is illustrated in Figure 4.

Figure 4. Typical Range of DC Leakage as a Function of Applied Voltage

DC leakage current (DCL) increases with increasing temperature according to the typical curve of Figure 5.

Figure 5. Typical Effect of Temperature upon DC Leakage Current

Leakage current is measured at a rated voltage through +85°C and may also be measured at +125°C at 2/3 of rated voltage applied.

8. RATED VOLTAGE

This term refers to the maximum continuous working voltage permissible at temperatures of +85° C or below. The lower operating temperature is specified for some series. Operation above +85° C is permissible, but at a reduced working voltage. Typical working voltage ratio is to 2/3 of rated voltage at +125° C.

ated to 125 °C with working voltage linearly derated to 2/3 of the 85°C rating at 125°C as shown in Figure 6.

Figure 6. Working Voltage Change with Temperature

10. SURGE VOLTAGE

Surge voltage is defined as the maximum voltage to which the capacitor should be subjected under transient conditions, including peak AC ripple and all DC transients.

DC Working Voltage @ 85°C	2	3	4	6	10	15/16	20	25	35	50	60	75	100	125
Surge Voltage @ 85°C	2.6	4	5.3	8	13	20	26	33	46	65	78	98	130	140

TABLE 1 Surge Voltage Ratings

A typical surge voltage test is performed at +85°C with the applicable surge voltage per Table 1. The surge voltage is applied for 1000 cycles of 30 seconds on voltage through a 33 ohm series resistor and 30 seconds off voltage with the capacitor discharged through a 33 ohm resistor. Upon completing the test, the capacitors are allowed to stabilize at room temperature. Capacitance, DF, and DCL are then tested:

1. The DCL should not exceed the initial 25°C limit.
2. The capacitance should be within ±10% of initial value.
3. The DF should not exceed the initial 25°C limit.

11. REVERSE VOLTAGE

Although these are polar capacitors, some degree of transient voltage reversal is permissible, as seen below. The capacitors should not be operated continuously in reverse mode, even within these limits.

Temperature, °C.	Percentage of Rated Voltage
+25	15
+85	5
+125	1

TABLE 2 Reverse Voltage Ratings

12. EQUIVALENT SERIES RESISTANCE (ESR)

Equivalent Series Resistance (ESR) is the preferred high-frequency statement of the resistance unavoidably appearing in these capacitors. ESR is not a pure resistance, and it decreases with increasing frequency. Typical ESR limits are established in each specific product series. However, the ESR limits provided are for reference only, and are not necessarily the actual value that a particular Series product will attain.

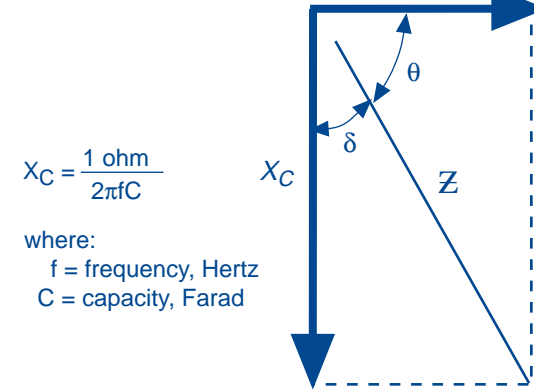

Figure 7a Total Impedance of the Capacitor Below Resonance

Figure 7b Total Impedance of the Capacitor Above Resonance

To understand the many elements of a capacitor Figure 8.

Figure 8. The Real Capacitor

A capacitor is a complex impedance consisting of many series and parallel elements, each adding to the complexity of the measurement system.

L — Represents lead wire and construction inductance. In most instances (especially in solid tantalum

RL — Capacitor Leakage Resistance. Typically it can reach 50,000 megohms in a tantalum capacitor. It can exceed 1012 ohms in monolithic ceramics and in film capacitors.

Rd — The dielectric loss contributed by dielectric absorption and molecular polarization. It becomes very significant in high frequency measurements and applications. Its value varies with frequency.

Cd — The inherent dielectric absorption of the solid tantalum capacitor which typically equates to 1-2% of the applied voltage.

As frequency increases, X_c continues to decrease according to its equation above. There is unavoidable inductance as well as resistance in all capacitors, and at some point in frequency, the reactance ceases to be capacitive and becomes inductive. This frequency is called the self-resonant point. In solid tantalum capacitors, the resonance is damped by the ESR, and a smooth, rather than abrupt, transition from capacitive to inductive reactance ($X_L = 2\pi fL$) follows.

Figure 9. ESR and Impedance vs. Frequency

Figure 10. ESR and Impedance vs. Frequency

Figure 11a. ESR and Impedance vs. Frequency

Typical ESR and Z performance is given for representative capacitor ratings in Figures 9 through 11. Measured impedance will be affected by the length of wire included. Data for the curves were taken by including 1/2" of each lead wire in the measuring circuit.

Despite the fact that the reactance is entirely inductive above the self-resonance, these capacitors find use as decoupling devices above 10 MHz. Special designs have been developed for minimum inductance and used above 100 MHz.

ESR and Z are also affected by temperature. At 100 kHz, ESR decreases with increasing temperature. The amount of change is influenced by the size of the capacitor and is generally more pronounced on smaller ratings.

Figure 11b Typical Effect of Temperature on 100 kHz ESR

13. POWER DISSIPATION

Permissible power dissipation has been empirically established for all Series and is listed in each respective product section.

See pages 6-41 for herm seal, 42-50 for axial radial molded, and 61-70 for tantalum dipped.

It is usually most convenient to translate the permissible power into an AC voltage rating. Assuming a sinusoidal waveform, the "ripple voltage" permissible may be calculated from the impedance and ESR data shown in respective product section. However, three criteria be observed:

3. The negative peak AC voltage, in combination with the DC voltage, must not exceed the permissible reverse voltage at the ambient temperature.

The rms ripple voltage limitation imposed by power dissipation is given by:

$$P = I^2R = \frac{E^2R}{Z^2}$$

where: I = rms ripple current (amperes)
 E = rms ripple voltage (volts)
 P = power (watts)
 Z = impedance at specified frequency (ohms)
 R = equivalent series resistance at specified frequency (ohms)

Maximum allowable rms ripple voltage may be determined as follows:

$$E(\text{max}) @ 25^\circ\text{C} = Z \sqrt{\frac{P(\text{max})}{R}}$$

E(max) = 85°C = 0.9 E(max) @ 25°C
 E(max) @ 125°C = 0.4 E(max) @ 25°C
 P(max) = maximum watts shown on Performance Characteristic pages 5, 42, 49, 58 and 61.

Permissible AC ripple current can be determined by the following:

$$I_{\text{rms}} = \sqrt{\frac{P(\text{max})}{R}}$$

If two polar capacitors are connected back-to-back, (1) the pair may be operated on AC without need for DC bias. The first two criteria above must be observed. If DC is applied, the sum of DC and peak AC must not exceed, in either direction, the maximum working voltage specified for the ambient temperature.

(1) Some KEMET Series provide convenient assemblies of non-polar pairs. The two negative terminals are connected internally. It is also permissible to connect the two positive terminals to form a non-polar pair.

14. LONG-TERM STABILITY

Within the general class of electrolytic capacitors, solid tantalum capacitors offer unusual stability of the three important parameters: capacitance, dissipation factor, and leakage current. These solid-state devices are not subject to the effects of electrolysis, deforming or drying-out associated with liquid-electrolyte capacitors.

When stabilized for measurement at standard conditions, capacitance will typically change less than ±3% during a 10,000 hour life test +85° C. The same comparative change has been observed in shelf tests at +25° C extending for 50,000 hours. (Some of this change may stem from instrument or fixture error.)

Dissipation factor exhibits no typical trend. Data from 10,000 hour life tests at +85° C show that initial limits (at standard conditions) are not exceeded at the conclusion of these tests.

Leakage current is more variable than capacitance or DF; in fact, leakage current typically exhibits a logarithmic dependence in several respects. MIL-C-39003/1 permits leakage current (measured at standard conditions) to rise

no discernable effect on the usual circuit designs.

15. FAILURE MODE

Capacitor failure may be induced by exceeding rated conditions of forward DC voltage, reverse DC voltage, surge voltage, surge current, power dissipation, temperature. As with any practical device, these capacitors also possess an inherent, although low, failure rate when operated within the rated condition.

The dominant failure mode is by short-circuit. Most parametric drifts (see Section 14 "Long-Term Stability") of no consequence in circuits suitable for solid tantalum capacitors. Catastrophic failure occurs as an avalanche DC leakage current over a short (millisecond) time span. The failed capacitor, while called "short-circuited" exhibit a DC resistance of 10 to 104 ohm.

If a failed capacitor is in an unprotected low-impedance circuit, continued flow of current through the capacitor may obviously produce severe overheating. This may melt the internal solder (all Series) and the solder used in hermetic Series. The short-circuit failure may thereby be converted to an open-circuit failure. If the circuit does not open promptly, the over-heated capacitor may damage the circuit board or nearby components. Protection against such occurrence is obtained by current limiting devices or fuses provided by the circuit designer.

Fortunately, the inherent failure rate of KEMET tantalum capacitors is low, and this failure rate may be further improved by circuit design. Statistical failure rates provided for those capacitors with characters other than "A" in the next-to-last position of the part number. Reliability of circuit conditions to failure rate is aided by the guidelines in the section following.

16. RELIABILITY PREDICTION

Three important application conditions largely control failure rate: DC voltage, temperature, and circuit impedance. Estimates of the respective effects are provided in the nomograph in Figure 12 and Table 3 following. The nomograph related failure rate to voltage and temperature while the table relates failure rate to impedance. These estimates apply to steady-state DC conditions, and assume usage within all other rated conditions.

Standard conditions, which produce a unity failure rate factor, are rated voltage, +85° C, and 0.1 ohm-percentage circuit impedance. While voltage and temperature are straightforward there is sometimes difficulty in determining impedance. What is required is the circuit impedance seen by the capacitor. If several capacitors are connected in parallel, the impedance seen by each is lowered by the source of energy stored in the other capacitors. Energy is similarly stored in series inductors.

Failure rate is conventionally expressed in units of percent per thousand hours. As a sample calculation, suppose a particular batch of capacitors has a failure rate of 0.5% Khr under standard conditions. What would be the predicted failure rate at 0.7 times rated voltage, +60° C, and 0.8Ω/V? The nomograph gives a factor of 7 x 10⁻⁴, and the table gives a factor of 0.3. The failure rate estimate is

$$0.5 \times 7 \times 10^{-4} \times 0.3 = 1.05 \times 10^{-4}, \text{ or } 0.0001\% \text{ Khr}$$

Figure 12. Reliability Nomograph

Circuit Impedance (ohms/volt)	Failure Rate Improvement (multiplying factors)
0.1	1.0
0.2	.8
0.4	.6
0.6	.4
0.8	.3
1.0	.2
2.0	.1
3 or greater	.07

TABLE 3 Relationship of Failure Rate to Impedance

Voltage “de-rating” is a common and useful approach to improved reliability. It can be pursued too far, however, when it leads to installation of higher voltage capacitors of much larger size. Inherent failure rate is roughly proportional to $CV^{1.6}$, where C is capacitance and V is rated voltage. The effect becomes particularly noticeable above 50-volt ratings. It is possible to lose more via higher inherent failure rate than is gained by voltage derating.

The relationships shown are more useful when the failure rate has been statistically determined for a given group of capacitors.

Failure rate is statistically determined for each production batch of KEMET High Reliability capacitors, as described in Specification GR500 Catalog F2956. As noted above, not all capacitance/voltage rate values are inherently equal in failure rate. GR500 capacitors are processed and subjected to 100% reliability testing as a homogeneous group of one capacitance/voltage value. Failure rate under standard conditions is available from 1 to 0.001% Khr, depending upon the capacitance/voltage value.

Several Series are qualified under U.S. military specification MIL-C-39003. Failure rates as low as 0.001%/Khr are available for all capacitance/voltage values in given groups under this test program. The specifications and

data is 60%. However, the cost of sampling each produced is overwhelmingly prohibitive, and no claim made concerning knowledge of failure rate for any particular lot shipped. It is demonstrated that average failure rate for all commercial Series is between .1 and 1%/Khr standard conditions and 60% confidence after 2000 hours' testing, +85°C, and rated voltage and ≤ 1 ohm series resistance.

17. SURGE CURRENT

All conventional reliability testing is conducted under steady-state DC voltage. Experience indicates that AC voltage, within the limits prescribed, has little effect on failure rate. Heavy surge currents are possible in some applications, however. Circuit impedance may be very low (below the standard 0.1 ohm/volt) or there may be driving inductance to cause voltage “ringing.” Surge current failures appear during turn-on of equipment, for example.

Failure rate under current-surge conditions may not be predictable from conventional life test data. A surge current test is utilized to ensure against a high frequency of such failures, and a description is available free of charge. The test has been adopted for all capacitors under MIL-C-39003/06/09/10 and KEMET's GR500 specifications.

18. ENVIRONMENTAL CONSIDERATION

It is not possible to foresee all the conditions to which capacitors may be subjected. Following is a list of standard tests which every Series will survive. Data may be available (upon request) under more severe stresses for certain Series.

- LIFE TEST 85°C OR 125°C, 2000 Hours:** When subjected to 2000 hours at 85°C at full rated DC voltage or 125°C at 2/3 of 85°C voltage, the capacitor shall meet the following requirements when tested at 25°C:

 - The DCL shall be within 1.25 times the initial limit.
 - Capacitance shall be within $\pm 10\%$ of the initial measured value.
 - The DF shall not exceed the initial limit.
- SHELF LIFE +85°, 2000 hours.** Post test of capacitor shall meet the following requirements when tested at 25°C:

 - The DCL shall be within 1.5 times the initial limit.
 - Capacitance shall be within $\pm 10\%$ of the initial measured value.
 - The DF shall not exceed 1.5 times the initial limit.
- LEAD STRENGTH MIL-STD-202 Method 211:** Pull test will be performed as in MIL-STD-202, Method 211. The following details and exceptions shall apply.

 - Test condition letter—A
 - The body of the capacitor will be securely clamped during test.

- VIBRATION; HIGH FREQUENCY: Per MIL-STD-202, Method 204, Condition D, 10 Hz to 2000 Hz.
 - a. Mounting—Capacitors shall be mounted on a fixture by the body. Leads shall be supported by rigidly supported terminals.
 - b. Electrical load conditions—During the test, the specified DC rated voltage shall be applied to the capacitors.
 - c. Test condition letter—D (20 G).
 - d. Duration and direction of motion—4 hours in each of two mutually perpendicular directions (total of 8 hours), one parallel and the other perpendicular to the axis.
 - e. Measurements during vibration—During the last cycle, an electrical measurement shall be made to determine intermittent operation or open- or short-circuiting. Observations shall also be made to determine intermittent contact or arcing or open- or short-circuiting. Detecting equipment shall be sufficiently sensitive to detect any interruption with a duration of 0.5 ms, or greater.
 - f. Examination after test—Capacitors shall be visually examined for evidence of mechanical damage.
- SHOCK TEST: Per MIL-STD-202, Method 213. The following details shall apply:
 - a. Special mounting means—Capacitors shall be rigidly mounted on a mounting fixture by the body. When securing leads, care shall be taken to avoid pinching the heads.
 - b. Test-condition letter—I (100 G peak). 6 ms. (sawtooth)
 - c. Measurements and electrical loading during shock—During the test, observations shall be made to determine intermittent contact or arcing or open- or short-circuiting. Detecting equipment shall be sufficiently sensitive to detect any interruption with a duration of 0.5 ms. The DC rated voltage shall be applied to the capacitors during the test.
 - d. Examinations after test—Capacitors shall be visually examined for evidence of arcing, breakdown, and mechanical damage.
- HUMIDITY LIFE TEST: Capacitors shall be capable of withstanding 1000 hours at 55°C with an ambient humidity of 90-95% RH with rated DC voltage applied. After the capacitors have stabilized for a period of 24 hours at 25°C, they shall meet the following limits:
 - DCL shall not exceed 5 times the initial limit.
 - Capacitance shall be within $\pm 10\%$ of the initial value.
 - DF shall not exceed 2 times the initial limit.
- THERMAL SHOCK—MIL-STD-202, Method 107: Capacitors shall be subjected to thermal shock in accordance with MIL-STD-202, Method 107, Test Condition A. M39003 Components tested to MIL-STD-202, Method 107, Condition B. Measurements before and after
 - c. Final measurements are made after stabilization at room temperature.
- MOISTURE RESISTANCE—MIL-STD-202, Method 106: Capacitors shall be tested in accordance with MIL-STD-202, Method 106 including the following details:
 - a. Mounting—The capacitors shall be mounted by normal mounting means
 - b. Initial Measurements
 - c. Polarizing and Load Voltage—Not applicable
 - d. Final measurements—After the final cycle and wait 2 to 6 hours after removal of the capacitors from the humidity chamber, capacitance, dissipation factor, and DC leakage will be measured.
 - DCL should not exceed the initial 25°C limit.
 - Capacitance should be within $\pm 10\%$ of the initial measured value.
 - DF should not exceed the initial 25°C limit.
- RESISTANCE TO SOLVENTS — MIL-STD-202, Method 215:
 - Brushing required after test.
 - DCL meets limit shown in respective Part Number Tables.
 - Capacitance meets applicable tolerance.
 - DF meets limits shown in respective Part Number Tables.
 - No visible damage to case or marking.
- RESISTANCE TO SOLDERING HEAT — MIL-STD-202, Method 210, Test Condition. Letter B. (260° for 10 Sec.)
 - Leads shall be immersed to within $\frac{1}{4}$ inch of the capacitor body. Capacitance, DF, and DCL should meet the initial limits shown in respective Part Number Tables.
- SOLDERABILITY — MIL-STD-202, Method 208;
 - Number of terminations on each capacitor tested
 - Depth of insertion in flux and solder to within .125 inch of capacitor body.
- FLAMMABILITY — The encapsulant for Molded and Conformal Coated Product meets or exceeds the following requirements:
 - Underwriters Lab. UL 94V-0
 - Oxygen Index per ASTM-D-2863
 - 28% min.
- STABILITY AT LOW AND HIGH TEMPERATURE
 - 55°C to 125°C: Capacitors will be capable of withstanding extreme temperature testing a succession of continuous steps at +25°C, -55°C, +25°C, +85°C, +125°C, +25°C, in the order stated. Capacitors shall be brought to thermal stability at each

the following limits.

- Step 1, +25°C, DCL as indicated in original limit; capacitance within tolerance specified; DF as indicated in original limit shown in Part Number Tables.
- Step 2, -55°C, Capacitance within $\pm 10\%$ of initial value; ESR, DF within limit shown in Part Number Tables.
- Step 3, +25°C, DCL as indicated in original limit; capacitance within $\pm 5\%$ of initial value; ESR, DF within limit shown in Part Number Tables.
- Step 4, +85°C, DCL shall not exceed 10 times original DCL limit at 25°C. Capacitance shall be within $\pm 10\%$ of the initial value. DF shall be within 125% of limits shown in Part Number Tables. ESR shall be within limits shown in Part Number Tables.
- Step 5, +125°C, DCL shall not exceed 12.5 times the original limit at 25°C. Capacitance shall be within $\pm 12\%$ of initial value. DF shall be within 150% of limits shown in Part Number Tables. ESR shall be within limits shown in Part Number Tables.
- Step 6, +25°C, DCL as indicated in original limit; capacitance within $\pm 5\%$ of initial value; ESR, DF as indicated in original limit shown in Part Number Tables.

Note: M39003 specifies Δ 's and limits by individual slash sheet.

- DAMP HEAT, STEADY STATE: Meets requirements of IEC Publication 384-15, method IEC 68-2-3. Climatic category 55/125/56.

19. MOUNTING

All encapsulated Series fall into two general classes. The first is provided with leads extending from opposite ends of the body, generally along the principle axis of the body ("axial leads"). The second is provided with parallel leads extending from one side or face of the body ("radial leads"). With either type, mounting points are normally provided by the leads themselves.

Axial leads may be used for point-to-point wiring, but usually, the wires are bent at 90° from the capacitor axis for insertion through printed circuit (PC) boards. Axial capacitors supplied on reels for machine insertion will withstand the mechanical stresses of bending and insert-

With either axial or radial types, attention should be paid to treatment of the capacitors during mounting afterward under service conditions. Difficulty during mounting usually arises from lead damage or from overheating. Hand soldering technique or, more often, wave solder machines cause the overheating. The internal cathode connection on most Series is made between solder and a silver-pigmented paint. If too much heat is applied, this solder may remelt and degrade the silver-solder interface or cause a direct short-circuit.

KEMET's hermetically-sealed series has an internal space into which molten cathode solder may run, degrading the cathode connection and possibly flowing across the terminals to short-circuit the capacitor from the inside. It is also possible to remelt the solder which bonds the cathode of the glass-metal seal, causing loss of hermeticity and possibly a short-circuit. Finally, solder at the exit point of the positive wire may be remelted with similar effect. Cathode solder is a high-temperature alloy, however, and it is much less likely to be melted. (Re-dipping of lead wires is practiced by some users, introducing another hazard of remelting this solder).

Plastic-encased Series have only one site of solder on the internal cathode connection. The rate of heat transfer through the plastic is lower than through the metal cathode of hermetic Series, but conduction along the negative lead wire to remelt this solder is very similar. There is little internal void within plastic cases, so remelted solder tends to remain in its original location and solidify when heat is removed. Short-circuiting is very unlikely, but reliability of the internal connection may be compromised by leakage of silver from the paint into the molten solder. The same effect degrades the cathode connection in hermetic Series as well.

All encased capacitors will pass the Resistance to Soldering Heat Test of MIL-STD-202, Method 2003, Condition B. This test dips each leadwire into molten solder at +260° C for 10 seconds while the capacitor body is held vertically above the solder. KEMET capacitors will pass this test when the depth of immersion brings the capacitor body (or closest external solder joint, if it is used as in some hermetic Series) to a minimum distance of 0.100 inches from the solder surface. This demonstration of resistance to solder heat is in accordance with what is believed to be the industry standard. More severe test requirements must be considered reflective of an improper soldering process.

Shown in Figure 13 is a recommended solder wave profile for both axial and radial leaded solid tantalum capacitors.
