**CMOS STATIC RAM  
64K (8K x 8-BIT)**

**IDT7164S  
IDT7164L**

**FEATURES:**

- High-speed address/chip select access time
  - Military: 20/25/30/35/45/55/70/85ns (max.)
  - Commercial: 15/20/25/35/70ns (max.)
- Low power consumption
- Battery backup operation — 2V data retention voltage (L Version only)
- Produced with advanced CMOS high-performance technology
- Inputs and outputs directly TTL-compatible
- Three-state outputs
- Available in:
  - 28-pin DIP and SOJ
- Military product compliant to MIL-STD-883, Class B

**DESCRIPTION:**

The IDT7164 is a 65,536 bit high-speed static RAM organized as 8K x 8. It is fabricated using IDT's high-performance, high-reliability CMOS technology.

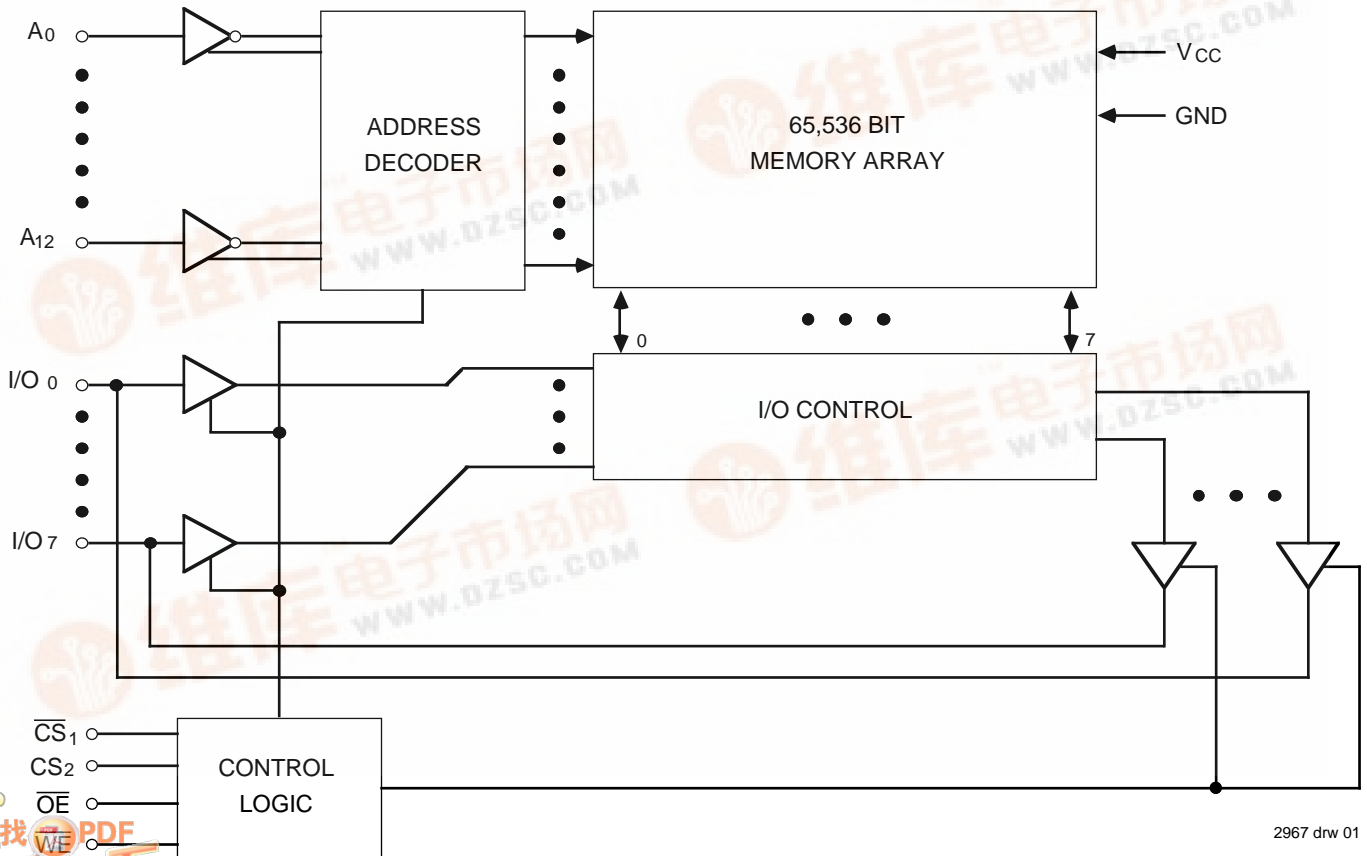

Address access times as fast as 15ns are available and the circuit offers a reduced power standby mode. When  $\overline{CS}_1$  goes HIGH or  $CS_2$  goes LOW, the circuit will automatically go to, and remain in, a low-power standby mode. The low-power (L) version also offers a battery backup data retention capability at power supply levels as low as 2V.

All inputs and outputs of the IDT7164 are TTL-compatible and operation is from a single 5V supply, simplifying system designs. Fully static asynchronous circuitry is used, requiring no clocks or refreshing for operation.

The IDT7164 is packaged in a 28-pin 300 mil DIP and SOJ; and 28-pin 600 mil DIP.

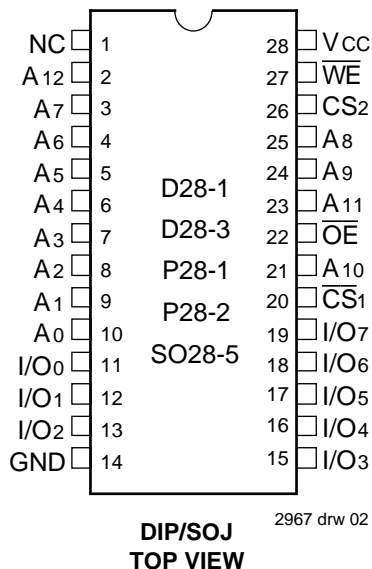

Military grade product is manufactured in compliance with the latest revision of MIL-STD-883, Class B, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

### NOTES:

2967 tbl 03

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>TERM</sub> must not exceed V<sub>CC</sub> + 0.5V.

**NOTES:**

1. WE is HIGH for Read cycle.
2. Device is continuously selected, CS1 is LOW, CS2 is HIGH.
3. Address valid prior to or coincident with CS1 transition LOW and CS2 transition HIGH.
4. OE is LOW.
5. Transition is measured ±200mV from steady state.

**TIMING WAVEFORM OF WRITE CYCLE NO. 2 ( $\overline{CS}$  CONTROLLED TIMING)<sup>(1, 2)</sup>**

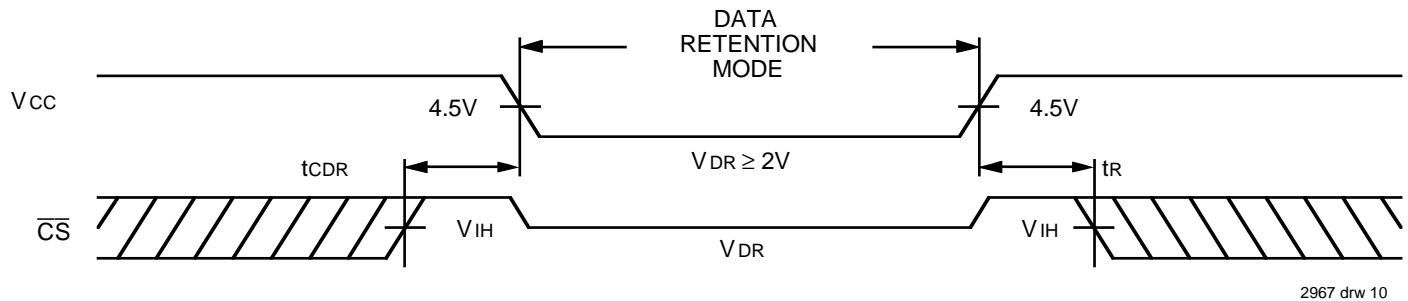

2967 drw 09

**NOTES:**

1.  $\overline{WE}$ ,  $\overline{CS1}$  or  $CS2$  must be inactive during all address transitions.
2. A write occurs during the overlap of a LOW  $\overline{WE}$ , a LOW  $\overline{CS1}$  and a HIGH  $CS2$ .
3.  $tWR1, 2$  is measured from the earlier of  $\overline{CS1}$  or  $\overline{WE}$  going HIGH or  $CS2$  going LOW to the end of the write cycle.
4. During this period, I/O pins are in the output state so that the input signals must not be applied.
5. If the  $\overline{CS1}$  LOW transition or  $CS2$  HIGH transition occurs simultaneously with or after the  $\overline{WE}$  LOW transition, the outputs remain in a high-impedance state.
6.  $\overline{OE}$  is continuously HIGH. If  $\overline{OE}$  is LOW during a  $\overline{WE}$  controlled write cycle, the write pulse width must be the larger of  $tWP$  or  $(tWHZ + tDW)$  to allow the I/O drivers to turn off and data to be placed on the bus for the required  $tDW$ . If  $\overline{OE}$  is HIGH during a  $\overline{WE}$  controlled write cycle, this requirement does not apply and the minimum write pulse width is as short as the specified  $tWP$ .
7. Transition is measured  $\pm 200mV$  from steady state.
