DESCRIPTION

The TC5516AP/AF is a 16384-bit static random access memory organized as 2048 words by 8 bit using CMOS technology, and operates from a single 5 volt supply.

The TC5516AP/AF is featured by two chip enable inputs, that is, $\overline{CE}_1$ for fast memory access and $\overline{CE}_2$ for a minimum standby current mode, and is suited for low power application where battery operation or battery back up for nonvolatility are required. Furthermore the TC5516APL/AFL guaranteed a

standby current equal to or less than $1\mu A$ at $60^\circ C$ ambient temperature is available.

The TC5516AP is also featured by pin compatibility with 2716 type EPROM. This means that the TC5516AP and EPROM can be interchanged in the same socket, and the flexibility in the definition of the quantity of RAM versus EPROM obtained as a result allows the wide application in microcomputer system.

NOTE: (1) R/W is high for a Read Cycle.

(2) t_{WP} is specified as the logical "AND" of $\overline{CE_1}$, $\overline{CE_2}$ and R/W.

t_{WP} is measured from the latter of $\overline{CE_1}$, $\overline{CE_2}$ or R/W going low to the earlier of $\overline{CE_1}$, $\overline{CE_2}$ or R/W going high.

(3) t_{DH} , t_{DS} are measured from the earlier of $\overline{CE_1}$, $\overline{CE_2}$ or R/W going high.

(4) If the $\overline{CE_1}$, or $\overline{CE_2}$ low transition occurs simultaneously with or latter from the R/W low transition in a Write Cycle 1, the output buffers remain in a high impedance state in this period.

(5) If the $\overline{CE_1}$ or $\overline{CE_2}$ high transition occurs prior to or simultaneously with the R/W high transition in a Write Cycle 1, the output buffers remain in a high impedance state in this period.

(6) If the R/W is low or the R/W low transition occurs prior to or simultaneously with the $\overline{CE_1}$ or $\overline{CE_2}$ low transition, the output buffers remain in a high impedance state in this period.

(7) A write occurs during the overlap of a low $\overline{CE_1}$, low $\overline{CE_2}$ and low R/W. In write cycle 2, write is controlled by either $\overline{CE_1}$ or $\overline{CE_2}$.
