

LT1636

# Over-The-Top Micropower Rail-to-Rail Input and Output Op Amp

## FEATURES

- Rail-to-Rail Input and Output
- Micropower: 50µA I<sub>Q</sub>, 44V Supply
- MSOP Package
- Over-The-Top™: Input Common Mode Range Extends 44V Above V<sub>EE</sub>, Independent of V<sub>CC</sub>
- Low Input Offset Voltage: 225µV Max
- Specified on 3V, 5V and ±15V Supplies
- High Output Current: 18mA
- Output Shutdown
- Output Drives 10,000pF with Output Compensation
- Reverse Battery Protection to 27V
- High Voltage Gain: 2000V/mV
- High CMRR: 110dB
- 220kHz Gain-Bandwidth Product

## APPLICATIONS

- Battery- or Solar-Powered Systems
  - Portable Instrumentation
  - Sensor Conditioning
- Supply Current Sensing
- Battery Monitoring
- MUX Amplifiers
- 4mA to 20mA Transmitters

## DESCRIPTION

The LT<sup>®</sup>1636 op amp operates on all single and split supplies with a total voltage of 2.7V to 44V drawing less than 50µA of quiescent current. The LT1636 can be shut down, making the output high impedance and reducing the quiescent current to 4µA. The LT1636 has a unique input stage that operates and remains high impedance when above the positive supply. The inputs take 44V both differential and common mode, even when operating on a 3V supply. The output swings to both supplies. Unlike most micropower op amps, the LT1636 can drive heavy loads; its rail-to-rail output drives 18mA. The LT1636 is unity-gain stable into all capacitive loads up to 10,000pF when a 0.22µF and 150Ω compensation network is used.

The LT1636 is reverse supply protected: it draws no current for reverse supply up to 27V. Built-in resistors protect the inputs for faults below the negative supply up to 22V. There is no phase reversal of the output for inputs 5V below V<sub>EE</sub> or 44V above V<sub>EE</sub>, independent of V<sub>CC</sub>.

The LT1636 op amp is available in the 8-pin MSOP, PDIP and SO packages.

LT, LTC and LT are registered trademarks of Linear Technology Corporation. Over-The-Top is a trademark of Linear Technology Corporation.

## TYPICAL APPLICATION

Over-The-Top Current Source with Shutdown

Input Bias Current vs Common Mode Voltage

			0.033			V/ $\mu s$
			0.030			V/ $\mu s$

The ● denotes specifications that apply over the full specified temperature range.

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** A heat sink may be required to keep the junction temperature below absolute maximum.

**Note 3:** The LT1636C is guaranteed to meet specified performance from  $0^\circ C$  to  $70^\circ C$  and is designed, characterized and expected to meet these extended temperature limits, but is not tested at  $-40^\circ C$  and  $85^\circ C$ . The LT1636I is guaranteed to meet the extended temperature limits.

**Note 4:**  $V_S = 5V$  limits are guaranteed by correlation to  $V_S = 3V$ , and  $V_S = \pm 15V$  or  $V_S = \pm 22V$  tests.

**Note 5:**  $V_S = 3V$  limits are guaranteed by correlation to  $V_S = 5V$ , and  $V_S = \pm 15V$  or  $V_S = \pm 22V$  tests.

**Note 6:** Guaranteed by correlation to slew rate at  $V_S = \pm 15V$ , and GBW at  $V_S = 3V$  and  $V_S = \pm 15V$  tests.

**Note 7:** This specification implies a typical input offset voltage of  $600\mu V$  at  $V_{CM} = 44V$  and a maximum input offset voltage of  $3mV$  at  $V_{CM} = 44V$ .

**Note 8:** This parameter is not 100% tested.

# LT1636

## TYPICAL PERFORMANCE CHARACTERISTICS

## APPLICATIONS INFORMATION

### Supply Voltage

The positive supply pin of the LT1636 should be bypassed with a small capacitor (about 0.01µF) within an inch of the pin. When driving heavy loads an additional 4.7µF electrolytic capacitor should be used. When using split supplies, the same is true for the negative supply pin.

The LT1636 is protected against reverse battery voltages up to 27V. In the event a reverse battery condition occurs, the supply current is less than 1nA.

When operating the LT1636 on total supplies of 20V or more, the supply must not be brought up faster than 1µs. This is especially true if low ESR bypass capacitors are used. A series RLC circuit is formed from the supply lead inductance and the bypass capacitor. 5Ω of resistance in the supply or the bypass capacitor will dampen the tuned circuit enough to limit the rise time.

### Inputs

The LT1636 has two input stages, NPN and PNP (see Simplified Schematic), resulting in three distinct operating regions as shown in the Input Bias Current vs Common Mode typical performance curve.

For input voltages about 0.8V or more below  $V^+$ , the PNP input stage is active and the input bias current is typically -4nA. When the input voltage is about 0.5V or less from  $V^+$ , the NPN input stage is operating and the input bias current is typically 10nA. Increases in temperature will

cause the voltage at which operation switches from the PNP stage to the NPN stage to move towards  $V^+$ . The input offset voltage of the NPN stage is untrimmed and is typically 600µV.

A Schottky diode in the collector of each NPN transistor of the NPN input stage allows the LT1636 to operate with either or both of its inputs above  $V^+$ . At about 0.3V above  $V^+$  the NPN input transistor is fully saturated and the input bias current is typically 3µA at room temperature. The input offset voltage is typically 600µV when operating above  $V^+$ . The LT1636 will operate with its input 44V above  $V^-$  regardless of  $V^+$ .

The inputs are protected against excursions as much as 22V below  $V^-$  by an internal 1k resistor in series with each input and a diode from the input to the negative supply. There is no output phase reversal for inputs up to 5V below  $V^-$ . There are no clamping diodes between the inputs and the maximum differential input voltage is 44V.

### Output

The output voltage swing of the LT1636 is affected by input overdrive as shown in the typical performance curves. When monitoring voltages within 100mV of  $V^+$ , gain should be taken to keep the output from clipping.

The output of the LT1636 can be pulled up to 27V beyond  $V^+$  with less than 1nA of leakage current, provided that  $V^+$  is less than 0.5V.

## APPLICATIONS INFORMATION

The normally reverse biased substrate diode from the output to  $V^-$  will cause unlimited currents to flow when the output is forced below  $V^-$ . If the current is transient and limited to 100mA, no damage will occur.

The LT1636 is internally compensated to drive at least 200pF of capacitance under any output loading conditions. A 0.22 $\mu$ F capacitor in series with a 150 $\Omega$  resistor between the output and ground will compensate these amplifiers for larger capacitive loads, up to 10,000pF, at all output currents.

### Distortion

There are two main contributors of distortion in op amps: output crossover distortion as the output transitions from sourcing to sinking current and distortion caused by nonlinear common mode rejection. Of course, if the op amp is operating inverting there is no common mode induced distortion. When the LT1636 switches between input stages there is significant nonlinearity in the CMRR. Lower load resistance increases the output crossover distortion, but has no effect on the input stage transition distortion. For lowest distortion the LT1636 should be operated single supply, with the output always sourcing current and with the input voltage swing between ground and ( $V^+ - 0.8V$ ). See the Typical Performance Characteristics curves.

### Gain

The open-loop gain is less sensitive to load resistance when the output is sourcing current. This optimizes performance in single supply applications where the load is

returned to ground. The typical performance photo of Open-Loop Gain for various loads shows the details.

### Shutdown

The LT1636 can be shut down two ways: using the shutdown pin or bringing  $V^+$  to within 0.5V of  $V^-$ . When  $V^+$  is brought to within 0.5V of  $V^-$  both the supply current and output leakage current drop to less than 1nA. When the shutdown pin is brought 1.2V above  $V^-$ , the supply current drops to about 4 $\mu$ A and the output leakage current is less than 1 $\mu$ A, independent of  $V^+$ . In either case the input bias current is less than 0.1nA (even if the inputs are 44V above the negative supply).

The shutdown pin can be taken up to 32V above  $V^-$ . The shutdown pin can be driven below  $V^-$ , however the pin current through the substrate diode should be limited with an external resistor to less than 10mA.

### Input Offset Nulling

The input offset voltage can be nulled by placing a 10k potentiometer between Pins 1 and 8 with its wiper to  $V^-$  (see Figure 1). The null range will be at least  $\pm 1mV$ .

Figure 1. Input Offset Nulling

**N8 Package**  
**8-Lead PDIP (Narrow 0.300)**  
 (LTC DWG # 05-08-1510)

- \*THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS. MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.010 INCH (0.254mm)

**S8 Package**  
**8-Lead Plastic Small Outline (Narrow 0.150)**  
 (LTC DWG # 05-08-1610)

- \*DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE
- \*\*DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED 0.010" (0.254mm) PER SIDE

# LT1636

## TYPICAL APPLICATIONS

Over-The-Top Comparator with Hysteresis

Self-Buffered Micropower Reference

Lamp Outage Detector

Over-The-Top Current Sense

## RELATED PARTS

PART NUMBER	DESCRIPTION	COMMENTS
LT1460	Micropower Precision Series Reference	Accuracy: 0.075% Max, Drift: 10ppm/°C Max, 2.5V, 5V, 10V Versions Available
LT1466/LT1467	75µA Dual/Quad Rail-to-Rail Input and Output Op Amps	390µV $V_{OS(MAX)}$ , Gain Bandwidth = 120kHz
LT1490/LT1491	50µA Dual/Quad Rail-to-Rail Input and Output Op Amps	950µV $V_{OS(MAX)}$ , Gain Bandwidth = 200kHz
LT1495/LT1496	1.5µA Max, Dual/Quad Precision Rail-to-Rail Input and Output Op Amps	375µV $V_{OS(MAX)}$ , 1.5µA Supply Current Max
LT2078/LT2079	55µA Dual/Quad Precision Single Supply Op Amps	120µV $V_{OS(MAX)}$ , Gain Bandwidth = 200kHz
LT2178/LT2179	17µA Dual/Quad Precision Single Supply Op Amps	120µV $V_{OS(MAX)}$ , Gain Bandwidth = 60kHz
