74ABT16373 16-Bit Transparent D-Type Latch with 3-STATE Outputs

General Description

The ABT16373 contains sixteen non-inverting latches with 3-STATE outputs and is intended for bus oriented applications. The device is byte controlled. The flip-flops appear transparent to the data when the Latch Enable (LE) is HIGH. When LE is LOW, the data that meets the setup time is latched. Data appears on the bus when the Output Enable (\overline{OE}) is LOW. When \overline{OE} is HIGH, the outputs are in high Z state.

Features

- Separate control logic for each byte
- 16-bit version of the ABT373
- High impedance glitch free bus loading during entire power up and power down cycle
- Non-destructive hot insertion capability
- Guaranteed latch-up protection

74ABT16373 16-Bit Transparent D-Type Latch with 3-STATE Outputs

Functional Description

The ABT16373 contains sixteen D-type latches with 3-STATE standard outputs. The device is byte controlled with each byte functioning identically, but independent of the other. Control pins can be shorted together to obtain full 16-bit operation. The following description applies to each byte. When the Latch Enable (LE_n) input is HIGH, data on the D_n enters the latches. In this condition the latches are transparent, i.e., a latch output will change states each time its D input changes. When LE_n is LOW, the latches store information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE_n . The 3-STATE standard outputs are controlled by the Output Enable (\overline{OE}_n) input. When \overline{OE}_n is LOW, the standard outputs are in the 2-state mode. When \overline{OE}_n is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the latches.
