January 1995

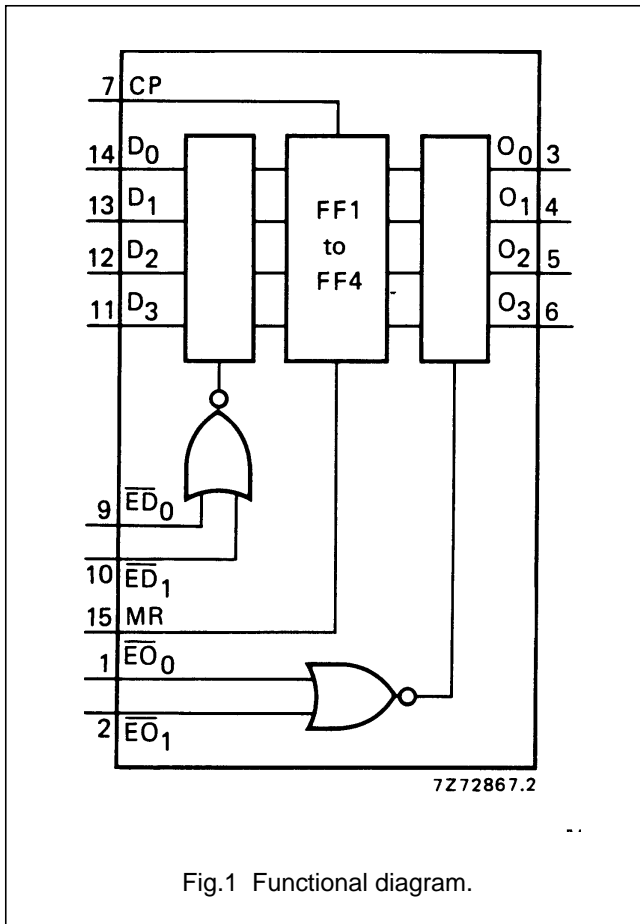

Quadruple D-type register with 3-state outputs

HEF4076B  
MSI

DESCRIPTION

The HEF4076B is a quadruple edge-triggered D-type flip-flop with four data inputs ( $D_0$  to  $D_3$ ), two active LOW data enable inputs ( $\overline{ED}_0$  and  $\overline{ED}_1$ ), a common clock input (CP), four 3-state outputs ( $O_0$  to  $O_3$ ), two active LOW output enable inputs ( $\overline{EO}_0$  and  $\overline{EO}_1$ ), and an overriding asynchronous master reset input (MR).

Information on  $D_0$  to  $D_3$  is stored in the four flip-flops on the LOW to HIGH transition of CP if both  $\overline{ED}_0$  and  $\overline{ED}_1$  are LOW. A HIGH on either  $\overline{ED}_0$  or  $\overline{ED}_1$  prevents the flip-flops from changing on the LOW to HIGH transition of CP, independent of the information on  $D_0$  to  $D_3$ . When both  $\overline{EO}_0$  and  $\overline{EO}_1$  are LOW, the contents of the four flip-flops are available at  $O_0$  to  $O_3$ . A HIGH on either  $\overline{EO}_0$  or  $\overline{EO}_1$  forces  $O_0$  to  $O_3$  into the high impedance OFF-state. A HIGH on MR resets all four flip-flops, independent of all other input conditions.

PINNING

- $D_0$  to  $D_3$  data inputs
- $\overline{ED}_0$ ,  $\overline{ED}_1$  data enable inputs (active LOW)
- $\overline{EO}_0$ ,  $\overline{EO}_1$  output enable inputs (active LOW)
- CP clock input (LOW to HIGH, edge-triggered)
- MR master reset input
- $O_0$  to  $O_3$  data outputs

FUNCTION TABLE

| INPUTS |            |                   |                   |       | OUTPUTS   |
|--------|------------|-------------------|-------------------|-------|-----------|
| MR     | CP         | $\overline{ED}_0$ | $\overline{ED}_1$ | $D_n$ | $O_n$     |
| H      | X          | X                 | X                 | X     | L         |
| L      | $\nearrow$ | H                 | X                 | X     | no change |
| L      | $\nearrow$ | X                 | H                 | X     | no change |
| L      | $\nearrow$ | L                 | L                 | H     | H         |
| L      | $\nearrow$ | L                 | L                 | L     | L         |
| L      | $\searrow$ | X                 | X                 | X     | no change |

Notes

- $\overline{EO}_0 = \overline{EO}_1 = \text{LOW}$   
When either  $\overline{EO}_0$  or  $\overline{EO}_1$  is HIGH, the outputs are disabled (high impedance OFF-state).  
H = HIGH state (the more positive voltage)  
L = LOW state (the less positive voltage)  
X = state is immaterial  
 $\nearrow$  = positive-going transition  
 $\searrow$  = negative-going transition

AC CHARACTERISTICS

$V_{SS} = 0 \text{ V}$ ;  $T_{amb} = 25 \text{ }^\circ\text{C}$ ;  $C_L = 50 \text{ pF}$ ; input transition times  $\leq 20 \text{ ns}$ ; see also waveforms Fig.4

MSI

Fig.4 Waveforms showing propagation delays, output disable/enable times, minimum CP and MR pulse widths, set-up and hold times for D<sub>n</sub> to CP and  $\overline{ED}_n$  to CP, and recovery time for MR. Set-up and hold times are shown as positive values but may be specified as negative values.
