#### **Functional Description**

The 74ALVC16827 contains twenty non-inverting buffers with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of each other. The control pins may be shorted together to obtain full 16-bit operation. The 3-STATE outputs are controlled by Output Enable ( $\overline{OE}_n$ ) inputs. When  $\overline{OE}_1$ , and  $\overline{OE}_2$  are LOW,  $O_0 - O_{10}$  are in the 2-state mode. When either  $\overline{OE}_1$ or  $\overline{OE}_2$  are HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the inputs. The same applies for byte two with  $\overline{\text{OE}}_3$  and  $\overline{\text{OE}}_4.$

the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3: I<sub>O</sub> Absolute Maximum Rating must be observed, limited to 4.6V. Note 4: Floating or unused control inputs must be held HIGH or LOW.
