## LOW-DROPOUT REGULATORS — HIGH EFFICIENCY

### A82xxSLH

Dwg. PS-021-4

### ABSOLUTE MAXIMUM RATINGS

Input Voltage, $V_I$	7 V
Peak Output Current, $I_{OM}$	100 mA*
Enable Input Voltage, $V_E$	$V_I$
Operating Temperature Range, $T_A$	-20°C to +85°C
Junction Temperature, $T_J$	+150°C
Storage Temperature Range, $T_S$	-40°C to +150°C

\* Output current rating is limited by input voltage, duty cycle, and ambient temperature. Under any set of conditions, do not exceed a junction temperature of +150°C. See following pages.

Designed specifically to meet the requirement for extended operation of battery-powered equipment such as cordless and cellular telephones, the A8220SLH thru A8233SLH voltage regulators offer the reduced dropout voltage and quiescent current essential for maximum battery life. Applicable also to palmtop computers and personal data assistants, these devices deliver a regulated output at up to 100 mA (transient), which is limited only by package power dissipation. Regulated output voltages of 2.6, 2.7, 2.8, 2.9, 3.0 and 3.3 are currently provided. Other voltages, down to 2.0 volts, are available on special order.

A PMOS pass element provides a typical dropout voltage of only 125 mV at 50 mA of load current. The low dropout voltage permits deeper battery discharge before output regulation is lost. Quiescent current does not increase significantly as the dropout voltage is approached, an ideal feature in standby/resume power systems where data integrity is crucial. Regulator accuracy and excellent temperature characteristics are provided by a bandgap reference. The A8220SLH thru A8233SLH include ENABLE inputs to give the designer complete control over power up, standby, or power down.

These devices are supplied in a thermally enhanced 5-lead small-outline plastic package similar to the SOT-23, and fitting the SC-74A footprint. All devices are rated for operation over a temperature range of -20°C to +85°C.

### FEATURES AND BENEFITS

- High Efficiency Provides Extended Battery Life
- 125 mV Typical Dropout Voltage at  $I_O = 50$  mA
- 32  $\mu$ A Typical Quiescent Current  
Less Than 1  $\mu$ A "Sleep" Current
- Low Output Noise
- 100 mA Peak Output Current
- Improved PSRR and Transient Performance

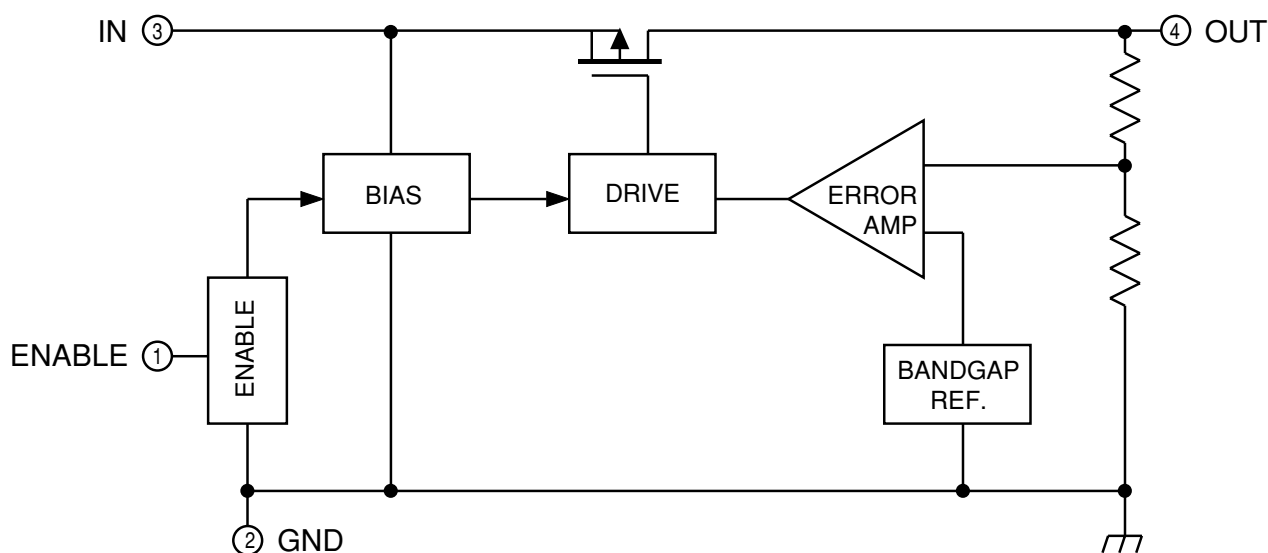

### APPLICATIONS

- Cordless and Cellular Telephones
- Personal Data Assistants
- Personal Communicators
- Palmtop Computers

Always order by complete part number, e.g., **A82xxSLH**, where "xx" is the required output voltage in tenths.

## FUNCTIONAL BLOCK DIAGRAM

Dwg. FS-012-9

**A82xxSLH Maximum Allowable Average Output Current\*** with device mounted on 2.24" x 2.24" (56.9 mm x 56.9 mm) solder-coated copper-clad board in still air.

$T_A$	Allowable Total Average (10 ms) Output Current in Milliamperes with $T_J = 150^\circ\text{C}$ , Duty Cycle = 100%†						
	$V_I - V_O$						
	1.5	2.0	2.5	3.0	3.5	4.0*	4.5*
25°C	100	100	100	100	100	100	100
50°C	100	100	100	100	100	100	100
70°C	100	100	100	100	100	91	81
85°C	100	100	100	98	84	74	66

\* Absolute maximum peak output current rating is 100 mA; absolute maximum input voltage is 7 V.

†  $I_O = (T_J - T_A) / ([V_I - V_O] R_{\theta JA} \times \text{dc}) = (150 - T_A) / ([V_I - V_O] \times 220 \times 1.00)$

Output current rating can be increased (to 100 mA maximum) by additional heat sinking or reducing the duty cycle.

## TYPICAL CHARACTERISTICS (concluded)

### LOAD TRANSIENT PERFORMANCE

$V_I = 3.2 \text{ V to } 6.2 \text{ V}$ ,  $C_O = 4.7 \mu\text{F}$ ,  $T_A = 25^\circ\text{C}$

Dwg. WP-028-3

### ENABLE TRANSIENT PERFORMANCE

$V_I = 3.2 \text{ V to } 6.2 \text{ V}$ ,  $C_O = 1 \mu\text{F}$ ,  $T_A = 25^\circ\text{C}$

Dwg. WP-027-3

## APPLICATIONS INFORMATION

Linear regulators require input and output capacitors in order to maintain over-all loop stability. The recommended minimum value for the input capacitor is 0.1  $\mu\text{F}$ . The output capacitor is the dominant pole that provides the high-frequency compensation required for over-all regulator loop stability. These devices are stable with as little as 1  $\mu\text{F}$ . However, to ensure stable operation under all conditions and capacitor types, the recommended minimum value is 4.7  $\mu\text{F}$ . The output capacitor may be partially distributed through the load circuits. However, at least 1  $\mu\text{F}$  should be connected at the regulator using the shortest and widest foil pattern possible.

### Thermal Considerations

These devices are intended to provide up to 100 mA of load current in a very small package. The table on page 2 of this data sheet gives the maximum allowable average output current for a worst-case printed circuit design ( $R_{\theta JA} = 220^\circ\text{C/W}$  with a minimum footprint). Performance improvement is easily accomplished with the addition of 1 square inch of copper at terminal 2 ( $R_{\theta JA} = 170^\circ\text{C/W}$ ).
