# Hex D Master-Slave Flip-Flop With Reset

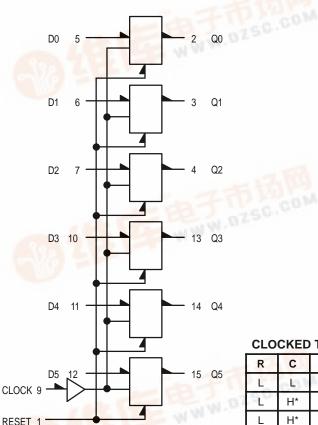

The MC10186 contains six high–speed, master slave type "D" flip–flops. Clocking is common to all six flip–flops. Data is entered into the master when the clock is low. Master to slave data transfer takes place on the positive–going Clock transition. Thus, outputs may change only on a positive–going Clock transition. A change in the information present at the data (D) input will not affect the output information any other time due to the master–slave construction of this device. <u>A COMMON RESET IS INCLUDED IN THIS CIRCUIT. RESET</u> <u>ONLY FUNCTIONS WHEN CLOCK IS LOW</u>.

 $\begin{array}{l} \mathsf{P}_{D} = 460 \text{ mW typ/pkg (No Load)} \\ \mathsf{f}_{toggle} = 150 \text{ MHz (typ)} \\ \mathsf{t}_{r}, \, \mathsf{t}_{f} = 2.0 \text{ ns typ } (20\%\text{--}80\%) \end{array}$

† Output level to be measured after clock pulse. VIL appears at clock input (Pin 9).

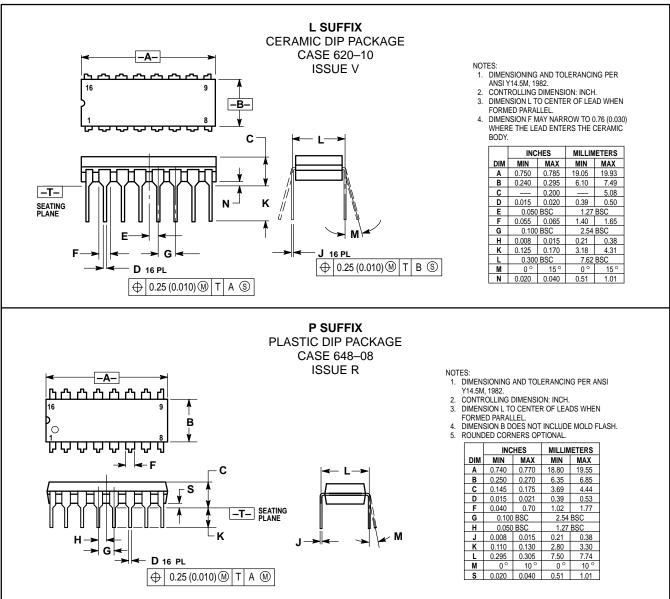

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50–ohm resistor to –2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.
