## 87C196KT／87C196KS

## ADVANCED 16－BIT CHMOS MICROCONTROLLER

Automotive

$$
\left(-40^{\circ} \mathrm{Cb}+125^{\circ} \mathrm{C} \text { Ambient }\right)
$$

■ High Performance CHMOS 16－Bit CPU
■ Up to 32 Kbytes of On－Chip EPROM
■ Up to 1 Kbyte of On－Chip Register RAM
－Up to 512 Bytes of Additional RAM （Code RAM）
－Register－Register Architecture
－ 8 Channel／10－Bit A／D with Sample／Hold
－ 37 Prioritized Interrupt Sources
■ Up to Seven 8－Bit（56）I／O Ports
■ Full Duplex Serial I／O Port
－Dedicated Baud Rate Generator
－Interprocessor Communication Slave Port
－Selectable Bus Timing Modes for Flexible Interfacing
－High Speed Peripheral Transaction Server（PTS）
■ Two Dedicated 16－Bit High－Speed Compare Registers
－ 10 High Speed Capture／Compare（EPA）
■ Full Duplex Synchronous Serial I／O Port（SSIO）

■ Two Flexible 16－Bit Timer／Counters
－Quadrature Counting Inputs
■ Flexible 8－／16－Bit External Bus （Programmable）
■ Programmable Bus（HLD／HLDA）
■ $1.75 \mu \mathrm{~s} 16 \times 16$ Multiply
■ $3 \mu \mathrm{~s} 32 / 16$ Divide
■ 68－Pin PLCC Package

## ■ Oscillator Fail Detection Circuitry

The 87C196Kx devices represents the 4th generation of MCS ${ }^{\circledR} 96$ microcontroller products implemented on Intel＇s advanced 1 micron process technology．These products are based on the 80C196KB device with enhancements ideal for automotive applications．The instruction set is a true super set of the 80C196KB with a few new instructions．

The MCS 96 microcontroller family members are all high performance microcontrollers with a 16－bit CPU．The 87C196KT is composed of the high speed（ 16 MHz ）KX macrocore as well as the following peripherals：Up to 32 Kbytes of Program EPROM，up to 1 Kbytes of Register RAM（00－3FFH including SFRs），up to 512 bytes of code RAM（16－bit addressing modes）with the ability to execute from this RAM space，an eight channel－10 Bit $\pm 3$ LSB analog to digital converter with programmable $\mathrm{S} / \mathrm{H}$ times with conversion times $<20 \mu \mathrm{~s}$ at 16 MHz ，an asynchronous／synchronous serial I／O port（8096 compatable）with a dedicated 16－bit baud rate generator，an additional synchronous serial I／O port with full duplex master／slave transceivers，a flexible timer／counter structure with prescaler，cascading，and quadrature capabilities， 10 modularized multiplexed high speed I／O for capture and compare（called Event Processor Array）with 250 ns resolution and double buffered inputs， and a sophisticated prioritized interrupt structure with programmable Peripheral Transaction Server（PTS）．The PTS has several channel modes，including single／burst block transfers from any memory location to any memory location，a PWM and PWM toggle mode to be used in conjunction with the EPA，and an A／D scan mode．

Additional SFR space is allocated for the EPA and can be＂windowed＂into the lower Register RAM area．

NOTICE：
This datasheet contains information on products in production．The specifications are subject to change without notice．Verify with your local Intel Sales office that you have the latest data sheet before finalizing a design．

| Device | Pins/Package | EPROM | Reg RAM | Code RAM | I/O | EPA | SIO | SSIO | A/D |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 87C196KT | 68 -Pin PLCC | 32 K | 1 K | 512 b | 56 | 10 | Y | Y | 8 |
| 87 C 196 KS | 68 -Pin PLCC | 24 K | 1 K | 256 b | 56 | 10 | Y | Y | 8 |

NOTE:
This is a PRODUCT PREVIEW DATA SHEET. The AC and DC parameters contained within this data sheet may change after full automotive temperature characterization of the device has been performed. Contact your local sales office before finalizing the Timing and D.C. characteristics of a design to verify you have the latest information.

## ARCHITECTURE

The KT/KS are new members of the MCS-96 family having the same architecture and use the same instruction set as the 80C196KB. Many new features have been added including:

## CPU FEATURES

■ Powerdown and Idle Modes

- 16 MHz Operating Frequency
- A High Performance Peripheral Transaction Server (PTS)
■ 37 Interrupt Vectors
- Up to 512 Bytes of Additional Code RAM
■ Up to 1 Kbyte of Additional Register RAM
■ "Windowing" Allows 8-Bit Addressing to some 16-Bit Addresses
■ $1.75 \mu \mathrm{~s} 16 \times 16$ Multiply
- $3 \mu \mathrm{~s}$ 32/16 Divide
- Oscillator Fail Detect Circuitry

## PERIPHERAL FEATURES

- Programmable A/D Conversion and S/H Times
- 10 Capture/Compare I/O with 2 Flexible Timers (250 ns Resolution and Double Buffered Inputs)
- Synchronous Serial I/O Port for Full Duplex Serial I/O
- Synchronous/Asynchronous Serial I/O Port (with Dedicated 16-Bit Baud Rate Generator)
- Total Utilization of ALL Available Pins (I/O Mux'd with Control)
- (2) 16-Bit Timers with Prescale, Cascading, and Quadrature Counting Capabilities
- Up to 12 Externally Triggered Interrupts

## NEW INSTRUCTIONS

$\mathrm{XCH} / \mathrm{XCHB}$ Exchange the contents of two locations, either Word or Byte is supported.
BMOVI Interruptable Block Move Instruction, allows the user to be interrupted during long executing Block Moves.
TIJMP Table Indirect JUMP. This instruction incorportes a way to do complex CASE level branches through one instruction. An example of such code savings: several interrupt sources and only one interrupt vector. The TIJMP instruction will sort through the sources and branch to the appropriate subcode level in one instruction. This instruction was added especially for the EPA structure, but has other code saving advantages.
EPTS/DPTS Enable and Disable Interrupts (Works like EI and DI).

## SFR OPERATION

A total of 1 Kbyte of Register RAM is implemented on the $87 \mathrm{C} 196 \mathrm{KT} / \mathrm{KS}$ devices. These locations support the on-chip peripherals that the 87C196KT/KS has (SFR's), as well as offering a data storage area. These locations are all 8 -bit directly addressable by use of the windowing technique. Any 32-, 64- or 128byte section can be relocated into the upper 32-, 64or 128 -byte area of the Register RAM area $080 \mathrm{H}-$ OFFH.

## inted.

## PIN DESCRIPTIONS

| Symbol | Name and Function |
| :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Main supply voltage ( +5 V ). |
| $\mathrm{V}_{\mathrm{SS}}, \mathrm{V}_{\mathrm{SSI}}, \mathrm{V}_{\mathrm{SSI}}$ | Digital circuit ground ( OV ). There are three $\mathrm{V}_{\text {SS }}$ pins, all of which MUST be connected. |
| $\mathrm{V}_{\text {REF }}$ | Reference for the $\mathrm{A} / \mathrm{D}$ converter ( +5 V ). $\mathrm{V}_{\text {REF }}$ is also the supply voltage to the analog portion of the A/D converter and the logic used to read Port 0 . Must be connected for $A / D$ and Port 0 to function. |
| $\mathrm{V}_{\mathrm{PP}}$ | Programming voltage for the EPROM parts. It should be +12.5 V for programming. It is also the timing pin for the return from powerdown circuit. Connect this pin with a $1 \mu \mathrm{~F}$ capacitor to $\mathrm{V}_{\mathrm{SS}}$ and a $1 \mathrm{M} \Omega$ resistor to $\mathrm{V}_{\mathrm{CC}}$. If this function is not used, $\mathrm{V}_{\mathrm{PP}}$ may be tied to $\mathrm{V}_{\mathrm{Cc}}$. |
| ANGND | Reference ground for the A/D converter. Must be held at nominally the same potential as $\mathrm{V}_{\mathrm{SS}}$. |
| XTAL1 | Input of the oscillator inverter and the internal clock generator. |
| XTAL2 | Output of the oscillator inverter. |
| P2.7/CLKOUT | Output of the internal clock generator. The frequency is $1 / 2$ the oscillator frequency. It has a $50 \%$ duty cycle. Also LSIO pin. |
| $\overline{\text { RESET }}$ | Reset input to the chip. Input low for at least 16 state times will reset the chip. The subsequent low to high transition resynchronizes CLKOUT and commences a 10state time sequence in which the PSW is cleared, bytes are read from 2018H and 201 AH loading the CCBs, and a jump to location 2080H is executed. Input high for normal operation. RESET has an internal pullup. |
| P5.7/BUSWIDTH | Input for bus width selection. If CCR bit 1 is a one and CCR1 bit 2 is a one, this pin dyamically controls the Buswidth of the bus cycle in progress. If BUSWIDTH is low, an 8 -bit cycle occurs, if BUSWIDTH is high, a 16 -bit cycle occurs. If CCR bit 1 is " 0 " and CCR1 bit 2 is " 1 ", all bus cycles are 8 -bit, if CCR bit 1 is " 1 " and CCR1 bit 2 is " 0 ", all bus cycles are 16 -bit. CCR bit $1=$ " 0 " and CCR1 bit $2=$ " 0 " is illegal. Also an LSIO pin when not used as BUSWIDTH. |
| NMI | A positive transition causes a non maskable interrupt vector through memory location 203EH. |
| P5.1/INST | Output high during an external memory read indicates the read is an instruction fetch. INST is valid throughout the bus cycle. INST is active only during external memory fetches, during internal EPROM fetches INST is held low. Also LSIO when not INST. |
| $\overline{E A}$ | Input for memory select (External Access). $\overline{E A}$ equal to a high causes memory accesses to locations 2000H through 9FFFH to be directed to on-chip EPROM/ROM. $\overline{E A}$ equal to a low causes accesses to these locations to be directed to off-chip memory. $\overline{\mathrm{EA}}=+12.5 \mathrm{~V}$ causes execution to begin in the Programming Mode. $\overline{\mathrm{EA}}$ is latched at reset. |
| P5.0/ALE/ $\overline{\text { ADV }}$ | Address Latch Enable or Address Valid output, as selected by CCR. Both pin options provide a latch to demultiplex the address from the address/data bus. When the pin is $\overline{\text { ADV, it goes inactive (high) at the end of the bus cycle. } \overline{\text { ADV }} \text { can be used as a chip }}$ select for external memory. ALE/ $\overline{\operatorname{ADV}}$ is active only during external memory accesses. Also LSIO when not used as ALE. |
| P5.3/ $\overline{\mathrm{RD}}$ | Read signal output to external memory. $\overline{\mathrm{RD}}$ is active only during external memory reads or LSIO when not used as $\overline{\text { RD. }}$ |
| P5.2/WR/ $\overline{\mathrm{WRL}}$ | Write and Write Low output to external memory, as selected by the CCR, $\overline{W R}$ will go Iow for every external write, while WRL will go low only for external writes where an even byte is being written. WR/WRL is active during external memory writes. Also an LSIO pin when not used as WR/WRL. |

PIN DESCRIPTIONS (Continued)

| Symbol | Name and Function |
| :---: | :---: |
| P5.5/ $\overline{\mathrm{BHE}} / \overline{\mathrm{WRH}}$ | Byte High Enable or Write High output, as selected by the CCR. $\overline{\mathrm{BHE}}=0$ selects the bank of memory that is connected to the high byte of the data bus. $\mathrm{A} O=0$ selects that bank of memory that is connected to the low byte. Thus accesses to a 16 -bit wide memory can be to the low byte only ( $\mathrm{AO}=0, \overline{\mathrm{BHE}}=1$ ), to the high byte only $(\mathrm{AO}=1, \overline{\mathrm{BHE}}=0)$ or both bytes $(\mathrm{AO}=0, \overline{\mathrm{BHE}}=0)$. If the WRH function is selected, the pin will go low if the bus cycle is writing to an odd memory location. $\overline{\mathrm{BHE}} / \overline{\mathrm{WRH}}$ is only valid during 16 -bit external memory write cycles. Also an LSIO pin when not BHE/WRH. |
| P5.6/READY | Ready input to lengthen external memory cycles, for interfacing with slow or dynamic memory, or for bus sharing. If the pin is high, CPU operation continues in a normal manner. If the pin is low prior to the falling edge of CLKOUT, the memory controller goes into a wait state mode until the next positive transition in CLKOUT occurs with READY high. When external memory is not used, READY has no effect. The max number of wait states inserted into the bus cycle is controlled by the CCR/ CCR1. Also an LSIO pin when READY is not selected. |
| P5.4/SLPINT | Dual function I/O pin. As a bidirectional port pin or as a system function. The system function is a Slave Port Interrupt Output Pin. |
| P6.2/T1CLK | Dual function I/O pin. Primary function is that of a bidirectional I/O pin, however, it may also be used as a TIMER1 Clock input. The TIMER1 will increment or decrement on both positive and negative edges of this pin. |
| P6.3/T1DIR | Dual function I/O pin. Primary function is that of a bidirectional I/O pin, however, it may also be used as a TIMER1 Direction input. The TIMER1 will increment when this pin is high and decrements when this pin is low. |
| $\begin{aligned} & \text { PORT1/EPA0-7 } \\ & \text { P6.0-6.1/EPA8-9 } \end{aligned}$ | Dual function I/O port pins. Primary function is that of bidirectional I/O. System function is that of High Speed capture and compare. EPA0 and EPA2 have yet another function of T2CLK and T2DIR of the TIMER2 timer/counter. |
| PORT 0/ACH0-7 | 8-bit high impedance input-only port. These pins can be used as digital inputs and/or as analog inputs to the on-chip A/D converter. These pins are also used as inputs to EPROM parts to select the Programming Mode. |
| P6.3-6.7/SSIO | Dual function I/O ports that have a system function as Synchronous Serial I/O. Two pins are clocks and two pins are data, providing full duplex capability. |
| PORT 2 | 8-bit multi-functional port. All of its pins are shared with other functions. |
| PORT 3 and 4 | 8-bit bidirectional I/O ports with open drain outputs. These pins are shared with the multiplexed address/data bus which has strong internal pullups. |

CCB1 (201AH : Byte)

| IRC2 | IRC1 | IRC0 | Max Wait States |
| :---: | :---: | :---: | :--- |
| 0 | 0 | 0 | Zero Wait States |
| 1 | 0 | 0 | 1 Wait State |
| 1 | 0 | 1 | 2 Wait States |
| 1 | 1 | 0 | 3 Wait States |
| 1 | 1 | 1 | INFINITE |

| MSEL1 | MSELO | Bus Timing Mode |
| :---: | :---: | :--- |
| 0 | 0 | Mode 0 (1-Wait KR) |
| 0 | 1 | Mode 1 |
| 1 | 0 | Mode 2 (KR) |
| 1 | 1 | Mode 3 (K) |

| BW1 | BW0 | Bus Width |
| :---: | :---: | :--- |
| 0 | 0 | ILLEGAL |
| 0 | 1 | 16-Bit Only |
| 1 | 0 | 8-Bit Only |
| 1 | 1 | BW Pin Controlled |

Mode $0 \quad$ Designed to be similar to the 87C196KR bus
(1-Wait KR): timing with 1 automatic wait state.
See AC Timings section for actual timings data.
Mode 1: $\overline{\mathrm{RD}}, \overline{\mathrm{WR}}$, advanced 1 TOSC
ALE advanced 0.5 TOSC
ALE pulse width remains 1 TOSC
Mode 2: $\overline{R D}, \overline{W R}$, advanced 1 TOSC
ALE advanced 0.5 TOSC
ALE pulse width remains 1 TOSC
Address advanced 0.5 TOSC
Mode 3 (KR): Designed to be similar to the 87C196KR bus timing.
See AC Timings section for actual timings data.

ABSOLUTE MAXIMUM RATINGS*
Storage Temperature $\ldots . . . . . .-60^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Voltage from $V_{P P}$ or $\overline{E A}$ to
$\mathrm{V}_{\text {SS }}$ or ANGND $\ldots . . . . . . . . .-0.5 \mathrm{~V}$ to +13.0 V
Voltage from Any Other Pin
to $V_{S S}$ or ANGND $\ldots \ldots \ldots \ldots . .-0.5$ to +7.0 V
This includes VPP on ROM and CPU devices.
Power Dissipation.
.0.5W

NOTICE: This is a production data sheet. The specifications are subject to change without notice.
*WARNING: Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.

OPERATING CONDITIONS

| Symbol | Parameter | Min | Max | Units |
| :--- | :--- | :---: | :---: | :---: |
| $\mathrm{T}_{\mathrm{A}}$ | Ambient Temperature Under Bias | -40 | +125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\mathrm{CC}}$ | Digital Supply Voltage | 4.50 | 5.50 | V |
| $\mathrm{~V}_{\text {REF }}$ | Analog Supply Voltage | 4.50 | 5.50 | V |
| $\mathrm{~F}_{\text {OSC }}$ | Oscillator Frequency | 4 | 16 | MHz (Note 4) |

note:
ANGND and $\mathrm{V}_{\text {SS }}$ should be nominally at the same potential.

DC CHARACTERISTICS (Under Listed Operating Conditions)

| Symbol | Parameter | Test Conditions | Min | Typ | Max | Units |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ICC | $\mathrm{V}_{\mathrm{CC}}$ Supply Current <br> ( $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ Ambient) | $\begin{aligned} & \text { XTAL1 }=16 \mathrm{MHz}, \\ & \mathrm{~V}_{\mathrm{CC}}=\mathrm{V}_{\mathrm{PP}}=\mathrm{V}_{\mathrm{REF}}=5.5 \mathrm{~V} \\ & \text { (While device in Reset) } \end{aligned}$ |  |  | 82 | mA |
| IREF | A/D Reference Supply Current |  |  |  | 5 | mA |
| IIDLE | Idle Mode Current | $\begin{aligned} & \text { XTAL1 }=16 \mathrm{MHz}, \\ & \mathrm{~V}_{\mathrm{CC}}=\mathrm{V}_{\mathrm{PP}}=\mathrm{V}_{\mathrm{REF}}=5.5 \mathrm{~V} \end{aligned}$ |  |  | 40 | mA |
| IPD | Powerdown Mode Current | $\mathrm{V}_{\mathrm{CC}}=\mathrm{V}_{\mathrm{PP}}=\mathrm{V}_{\mathrm{REF}}=5.5 \mathrm{~V}(6,9)$ |  | 50 | TBD | $\mu \mathrm{A}$ |
| $\mathrm{V}_{\text {IL }}$ | Input Low Voltage (all pins) | For PORTO(8) | -0.5V |  | $0.3 \mathrm{~V}_{\text {CC }}$ | V |
| $\mathrm{V}_{1 \mathrm{H}}$ | Input High Voltage | For PORTO(8) | $0.7 \mathrm{~V}_{\mathrm{CC}}$ |  | $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| $\mathrm{V}_{\mathrm{H} 1}$ | Input High Voltage XTAL1 | XTAL1 Input Pin Only ${ }^{(1)}$ | 0.7 VCC |  | $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| $\mathrm{V}_{\mathrm{H} 2}$ | Input High Voltage on RESET | RESET input pin only | $0.7 \mathrm{~V}_{\mathrm{CC}}$ |  | $V_{C C}+0.5$ | V |

DC CHARACTERISTICS (Under Listed Operating Conditions) (Continued)

| Symbol | Parameter | Test Conditions | Min | Typ | Max | Units |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| VOL | Output Low Voltage (Outputs Configured as Complementary) | $\begin{aligned} \mathrm{IOL} & =200 \mu \mathrm{~A}(3,5) \\ \mathrm{IOL} & =3.2 \mathrm{~mA} \\ \mathrm{IOL} & =7.0 \mathrm{~mA} \end{aligned}$ |  |  | $\begin{gathered} 0.3 \\ 0.45 \\ 1.5 \end{gathered}$ | $\begin{aligned} & \text { v } \\ & \text { v } \\ & \text { v } \end{aligned}$ |
| $\mathrm{V}_{\mathrm{OH}}$ | Output High Voltage (Outputs Configured as Complementary) | $\begin{aligned} & \mathrm{I}_{\mathrm{OH}}=-200 \mu \mathrm{~A}(3,5) \\ & \mathrm{I}_{\mathrm{OH}}=-3.2 \mathrm{~mA} \\ & \mathrm{I}_{\mathrm{OH}}=-7.0 \mathrm{~mA} \end{aligned}$ | $\begin{aligned} & \mathrm{V}_{\mathrm{CC}}-0.3 \\ & \mathrm{~V}_{\mathrm{CC}}-0.7 \\ & \mathrm{~V}_{\mathrm{CC}}-1.5 \\ & \hline \end{aligned}$ |  |  | $\begin{aligned} & \text { v } \\ & \text { v } \\ & \text { v } \end{aligned}$ |
| $\mathrm{ILI}^{\text {l }}$ | Input Leakage Current (Std. Inputs) | $\mathrm{V}_{\mathrm{SS}}<\mathrm{V}_{\text {IN }}<\mathrm{V}_{\text {CC }}$ |  |  | $\pm 10$ | $\mu \mathrm{A}$ |
| lıl1 | Input Leakage Current (Port 0) | $\mathrm{V}_{\text {SS }}<\mathrm{V}_{\text {IN }}<\mathrm{V}_{\text {REF }}$ |  |  | $\pm 1.5$ | $\mu \mathrm{A}$ |
| $\mathrm{V}_{\text {OH1 }}$ | SLPINT (P5.4) and HLDA (P2.6) Output High Voltage in RESET | $\mathrm{I}_{\mathrm{OH}}=0.8 \mathrm{~mA}{ }^{(7)}$ | 2.0 |  |  | V |
| $\mathrm{V}_{\mathrm{OH} 2}$ | Output High Voltage in RESET | $\mathrm{IOH}^{\prime}=-15 \mu \mathrm{~A}(1,8)$ | $\mathrm{V}_{C C}-1 \mathrm{~V}$ |  |  | V |
| $\mathrm{IOH}_{2}$ | Output High Current in RESET | $\begin{aligned} & \mathrm{V}_{\mathrm{OH} 2}=\mathrm{V}_{\mathrm{CC}}-1.0 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{OH} 2}=\mathrm{V}_{\mathrm{CC}}-2.5 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{OH} 2}=\mathrm{V}_{\mathrm{CC}}-4.0 \mathrm{~V} \end{aligned}$ | $\begin{aligned} & -30 \\ & -75 \\ & -90 \end{aligned}$ |  | $\begin{aligned} & -120 \\ & -240 \\ & -280 \end{aligned}$ | $\mu \mathrm{A}$ $\mu \mathrm{A}$ $\mu \mathrm{A}$ |
| $\mathrm{C}_{\text {S }}$ | Pin Capacitance (Any pin to $\mathrm{V}_{\text {SS }}$ ) | $\mathrm{f}_{\text {test }}=1.0 \mathrm{MHz}(6)$ |  |  | 10 | pF |
| $\mathrm{V}_{\text {OL3 }}$ | Output Low Voltage in RESET (RESET Pin Only) | $\begin{aligned} & \mathrm{I}_{\mathrm{OL3}}=4 \mathrm{~mA}(10) \\ & \mathrm{IOL3}=6 \mathrm{~mA} \\ & \mathrm{I}=8 \mathrm{~mA} \end{aligned}$ |  |  | $\begin{aligned} & 0.3 \\ & 0.5 \\ & 0.8 \end{aligned}$ | V |
| RWPU | Weak Pullup Resistance | (Note 6) |  | 150K |  | $\Omega$ |
| $\mathrm{R}_{\text {RST }}$ | Reset Pullup Resistor |  | 65K |  | 180K | $\Omega$ |

## NOTES:

1. All BD (bidirectional) pins except INST and CLKOUT. INST and CLKOUT are excluded due to their not being weakly pulled high in reset. BD pins include Port1, Port2, Port3, Port4, Port5 and Port6 except SPLINT (P5.4) and HLDA (P2.6).
2. Standard input pins include XTAL1, EA, RESET, and Port $1 / 2 / 5 / 6$ when setup as inputs.
3. All bidirectional I/O pins when configured as Outputs (Push/Pull).
4. Device is static and should operate below 1 Hz , but only tested down to 4 MHz .
5. Maximum $\mathrm{l}_{\mathrm{OL}} / \mathrm{I}_{\mathrm{OH}}$ currents per pin will be characterized and published at a later date.
6. Typicals are based on limited number of samples and are not guaranteed. The values listed are at room temperature and $V_{\text {REF }}=V_{C C}=5.0 \mathrm{~V}$.
7. Violating these specifications in reset may cause the device to enter test modes (P5.4 and P2.6).
8. When PO is used as analog inputs, refer to A/D specifications for this characteristic.
9. For temperatures $<100^{\circ} \mathrm{C}$ typical is $10 \mu \mathrm{~A}$.
10. This specification is not tested in production and is based upon theoretical estimates and/or product characterization.

## NOTES:

Icc Max $=3.25 \times$ Freq +30
${ }^{\text {IDLE }}$ Max $=1.25 \times$ Freq +20

AC CHARACTERISTICS (Over Specified Operating Conditions)
Test Conditions: Capacitance Load on All Pins $=100 \mathrm{pF}$, Rise and Fall Times $=10 \mathrm{~ns}$.
The 87C196KT will meet these specifications

| Symbol | Parameter | Min | Max | Units |
| :---: | :---: | :---: | :---: | :---: |
| FXTAL | Frequency on XTAL1 | 4.0 | 16.0 | $\mathrm{MHz}{ }^{(1)}$ |
| Tosc | XTAL1 Period (1/FXTAL) | 62.5 | 250 | ns |
| $\mathrm{T}_{\text {XHCH }}$ | XTAL1 High to CLKOUT High or Low | +20 | 110 | ns |
| TOFD | Clock Failure to Reset Pulled Low(6) | 4 | 40 | $\mu \mathrm{S}$ |

| TWHBX | $\overline{\text { BHE, INST Hold after WR High }}$ | Tosc - 10 |  | ns |
| $\mathrm{T}_{\text {WHAX }}$ | AD8-15 Hold after WR High | TOSC - 30 |  | ns(4) |
| T ${ }_{\text {RHBX }}$ | $\overline{\text { BHE, INST Hold after } \overline{\text { RD }} \text { High }}$ | TOSC - 10 |  | ns |
| $\mathrm{T}_{\text {RHAX }}$ | AD8-15 Hold after RD High | Tosc - 30 |  | ns(4) |

## NOTES:

1. Testing performed at 4.0 MHz , however, the device is static by design and will typically operate below 1 Hz . 2. Typical specifications, not guaranteed.
2. Assuming back-to-back bus cycles.
3. 8-bit bus only.
4. If wait states are used, add 2 Tosc $\times \mathrm{n}$, where $\mathrm{n}=$ number of wait states. If mode 0 ( 1 automatic wait state added) operation is selected, add 2 TOSC to specification.
5. TOFD is the time for the oscillator fail detect circuit (OFD) to react to a clock failure. The OFD circuitry is enabled by programming the UPROM location 0778 H with the value 0004 H . KT/KS customer QROM codes need to equate location 2016 H to the value OCDEH if the oscillator fail detect (OFD) function is desired. Intel manufacturing uses location 2016H as a flag to determine whether or not to program the Clock Detect Enable (CDE) bit. Programming the CDE bit enables oscillator fail detection.

AC CHARACTERISTICS (Over Specified Operating Conditions)
Test Conditions: Capacitance Load on All Pins $=100 \mathrm{pF}$, Rise anf Fall Times $=10 \mathrm{~ns}$.
The system must meet these specifications to work with the 87C196KT.

| Symbol | Parameter | Min | Max | Units |
| :---: | :---: | :---: | :---: | :---: |
| TAVYV | Address Valid to Ready Setup |  | 2 Tosc $^{\text {- }} 75$ | $n s{ }^{(3)}$ |
| TLLYV | ALE Low to READY Setup |  | Tosc - 70 | $n s{ }^{(3)}$ |
| TYLYH | Non READY Time | No Upper Limit |  | ns |
| TCLYX | READY Hold after CLKOUT Low | 0 | Tosc - 30 | $\mathrm{ns}{ }^{(1)}$ |
| TAVGV | Address Valid to BUSWIDTH Setup |  | 2 Tosc $^{\text {- }} 75$ | $\mathrm{ns}(2,3)$ |
| TLLGV | ALE Low to BUSWIDTH Setup |  | Tosc - 60 | $n \mathrm{n}(2,3)$ |
| TCLGX | BUSWIDTH Hold after CLKOUT Low | 0 |  | ns |
| $\mathrm{T}_{\text {AVDV }}$ | Address Valid to Input Data Valid |  | 3 TOSC - 55 | $\mathrm{ns}{ }^{(2)}$ |
| TRLDV | $\overline{\mathrm{RD}}$ active to input Data Valid |  | Tosc - 30 | $\mathrm{ns}{ }^{(2)}$ |
| TCLDV | CLKOUT Low to Input Data Valid |  | Tosc - 60 | ns |
| T ${ }_{\text {RHDZ }}$ | End of $\overline{\text { RD }}$ to Input Data Float |  | Tosc | ns |
| $\mathrm{T}_{\text {RHDX }}$ | Data Hold after $\overline{\text { RD High }}$ | 0 |  | ns |

## NOTES:

1. If Max is exceeded, additional wait states will occur.
2. If wait states are used, add 2 Tosc $\times \mathrm{n}$, where $\mathrm{n}=$ number of wait states.
3. If mode 0 is selected, one wait state minimum is always added. If additional wait states are required, add 2 Tosc to the specification.

2. These values are not tested in production, and are based upon theoretical estimates and/or laboratory tests.
3. Specifications above are advanced information and are subject to change.

87C196KT/87C196KS

EXTERNAL CLOCK DRIVE

| Symbol | Parameter | Min | Max | Units |
| :--- | :--- | :---: | :---: | :---: |
| $1 / T_{\text {XLXL }}$ | Oscillator Frequency | 4 | 16 | MHz |
| $\mathrm{T}_{\mathrm{XLXL}}$ | Oscillator Period (TOSC) | 62.5 | 250 | ns |
| $\mathrm{~T}_{\mathrm{XHXX}}$ | High Time | $0.35 \times \mathrm{T}_{\mathrm{OSC}}$ | $0.65 \mathrm{~T}_{\mathrm{OSC}}$ | ns |
| $\mathrm{T}_{\mathrm{XLXX}}$ | Low Time | $0.35 \times \mathrm{T}_{\mathrm{OSC}}$ | $0.65 \mathrm{~T}_{\mathrm{OSC}}$ | ns |
| $\mathrm{T}_{\mathrm{XLXH}}$ | Rise Time |  | 10 | ns |
| $\mathrm{~T}_{\mathrm{XHXL}}$ | Fall Time |  | 10 | ns |

## EXTERNAL CLOCK DRIVE WAVEFORMS

## AC TESTING INPUT, OUTPUT WAVEFORMS

AC Testing inputs are driven at 3.5 V for a logic " 1 " and 0.45 V for a logic " 0 ". Timing measurements are made at 2.0 V for a logic " 1 " and 0.8 V for logic " 0 ".

## THERMAL CHARACTERISTICS

| Device and Package | $\theta_{\text {JA }}$ | $\theta_{\text {JC }}$ |
| :--- | :---: | :---: |
| AN87C196KT/KS <br> $(68-L e a d ~ P L C C) ~$ | $36.5^{\circ} \mathrm{C} / \mathrm{W}$ | $13^{\circ} \mathrm{C} / \mathrm{W}$ |

## NOTES:

1. $\theta_{\mathrm{JA}}=$ Thermal resistance between junction and the surrounding environmental (ambient). Measurements are taken 1 ft . away from case in air flow environment. $\theta_{\mathrm{Jc}}=$ Thermal resistance between junction and package surface (case).
2. All values of $\theta_{\mathrm{JA}}$ and $\theta_{\mathrm{JC}}$ may fluctuate depending on the environment (with or without airflow, and how much airflow) and device power dissipation at temperature of operation. Typical variations are $\pm 2^{\circ} \mathrm{C} / \mathrm{W}$.
3. Values listed are at a maximum power dissipation of 0.50 W .

FLOAT WAVEFORMS

270999-18
For timing purposes a Port Pin is no longer floating when a 150 mV change from load voltage occurs and begins to float when a 150 mV change from the loading $\mathrm{V}_{\mathrm{OH}} / \mathrm{V}_{\mathrm{OL}}$ level occurs $\mathrm{l}_{\mathrm{OL}} / \mathrm{l}_{\mathrm{OH}} \leq 15 \mathrm{~mA}$.

## EXPLANATION OF AC SYMBOLS

Each symbol is two pairs of letters prefixed by "T" for time. The characters in a pair indicate a signal and its condition, respectively. Symbols represent the time between the two signal/condition points.

## Conditions:

H—High
L—Low
V—Valid
X—No Longer Valid Z—Floating

Signals:
A—Address HA— $\overline{\mathrm{HLDA}}$
$\mathrm{B}-\overline{\mathrm{BHE}} \quad \mathrm{L}-\mathrm{ALE} / \overline{\mathrm{ADV}}$
BR- $\overline{B R E Q}$
C-CLKOUT
D—DATA
G-Buswidth
H———OLD

Q—Data Out
RD- $\overline{R D}$
W——" $/ \overline{W R H} / \overline{W R I}$
X—XTAL1
Y-READY

## EPROM SPECIFICATIONS

AC EPROM PROGRAMMING CHARACTERISTICS
Operating Conditions: Load Capacitance $=150 \mathrm{pF} ; \mathrm{T}_{\mathrm{C}}=25^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{REF}}=5.0 \mathrm{~V} \pm 0.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}$, ANGND $=0 \mathrm{~V}$.
$\mathrm{V}_{\mathrm{PP}}=12.5 \mathrm{~V} \pm 0.25 \mathrm{~V} ; \overline{\mathrm{EA}}=12.5 \mathrm{~V} \pm 0.25 \mathrm{~V}$; Fosc $=5.0 \mathrm{MHz}$.

## NOTES:

1. Run-time programming is done with Fosc $=6.0 \mathrm{MHz}$ to $10.0 \mathrm{MHz}, \mathrm{V}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{PD}}, \mathrm{V}_{\mathrm{REF}}=5 \mathrm{~V} \pm 0.5 \mathrm{~V}, \mathrm{~T}_{\mathrm{C}}=25^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$ and $\mathrm{V}_{\mathrm{PP}}=12.5 \mathrm{~V} \pm 0.25 \mathrm{~V}$. For run-time programming over a full operating range, contact factory.
2. Programming specifications are not tested, but guaranteed by design.
3. This specification is for the word dump mode. For programming pulses use 300 Tosc $+100 \mu \mathrm{~s}$.

## WAVEFORM—SERIAL PORT—SHIFT REGISTER MODE

SERIAL PORT WAVEFORM—SHIFT REGISTER MODE

## A TO D CHARACTERISTICS

The sample and conversion time of the A/D converter in the 8 -bit or 10 -bit modes is programmed by loading a byte into the AD__TIME Special Function Register. This allows optimizing the A/D operation for specific applications. The AD__TIME register is functional for all possible values, but the accuracy of the A/D converter is only guaranteed for the times specified in the operating conditions table.

The value loaded into AD__TIME bits 5, 6, 7 determines the sample time, SAMP. The value loaded into $A D \_$TIME bits $0,1,2,3$ and 4 determines the bit conversion time, CONV. These bits, as well as the equation for calculating the total conversion time, T , are shown in the following table:

The converter is ratiometric, so absolute accuracy is dependent on the accuracy and stability of $\mathrm{V}_{\text {REF }}$. $\mathrm{V}_{\text {REF }}$ must be close to $\mathrm{V}_{\mathrm{CC}}$ since it supplies both the resistor ladder and the analog portion of the converter and input port pins. There is also an AD__TEST SFR that allows for conversion on ANGND and $\mathrm{V}_{\text {REF }}$ as well as adjusting the zero offset. The absolute error listed is without doing any adjustments.

## A/D CONVERTER SPECIFICATION

The specifications given assume adherence to the operating conditions section of this data sheet. Testing is performed with $\mathrm{V}_{\text {REF }}=5.12 \mathrm{~V}$ and 16 MHz operating frequency. After a conversion is started, the device is placed in IDLE mode until the conversion is complete.

10-BIT MODE A/D OPERATING CONDITIONS

| Symbol | Description | Min | Max | Units |
| :--- | :--- | :---: | :---: | :---: |
| $\mathrm{T}_{\mathrm{A}}$ | Ambient Temperature | -40 | +125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\mathrm{CC}}$ | Digital Supply Voltage | 4.50 | 5.50 | V |
| $\mathrm{~V}_{\text {REF }}$ | Analog Supply Voltage | 4.50 | 5.50 | $\mathrm{~V}^{(1)}$ |
| $\mathrm{T}_{\text {SAM }}$ | Sample Time | 2.0 |  | $\mu \mathrm{~s}^{(2)}$ |
| $\mathrm{T}_{\text {CONV }}$ | Conversion Time | 15 | 18 | $\mu \mathrm{~s}^{(2)}$ |
| $\mathrm{F}_{\text {OSC }}$ | Oscillator Frequency | 4.0 | 16.0 | MHz |

## NOTES

1. $\mathrm{V}_{\text {REF }}$ must be within 0.5 V of $\mathrm{V}_{\mathrm{CC}}$.
2. The value of AD_TIME is selected to meet these specifications.

## 10-BIT MODE A/D CHARACTERISTICS (Using Above Operating Conditions)(6)

| Parameter | Typ*(1) | Min | Max | Units* |
| :--- | :---: | :---: | :---: | :---: |
| Resolution |  | 1024 <br> 10 | 1024 <br> 10 | Level <br> Bits |
| Absolute Error |  | 0 | $\pm 3.0$ | LSBs |
| Full Scale Error | $0.25 \pm 0.5$ |  |  | LSBs |
| Zero Offset Error | $0.25 \pm 0.5$ |  |  | LSBs |
| Non-Linearity | $1.0 \pm 2.0$ |  | $\pm 3.0$ | LSBs |
| Differential Non-Linearity |  | -0.75 | +0.75 | LSBs |
| Channel-to-Channel Matching | $\pm 0.1$ | 0 | $\pm 1.0$ | LSBs |
| Repeatability | $\pm 0.25$ | 0 |  | LSBs $^{(1)}$ |
| Temperature Coefficients: | 0.009 |  |  |  |
| Offset <br> Full Scale <br> Differential Non-Linearity | 0.009 |  |  | LSB/C(1) $^{\text {LSB/C(1) }}$ |
| Off Isolation | 0.009 |  | -60 |  |
| Feedthrough | -60 |  |  | $\mathrm{~dB}(1,2,3)$ |
| VCC Power Supply Rejection | -60 |  |  | $\mathrm{~dB}(1,2)$ |
| Input Resistance |  | 750 | 1.2 K | $\Omega^{(4)}$ |
| DC Input Leakage | 3.0 |  | $\pm 1.5$ | $\mu \mathrm{~A}$ |
| Sampling Capacitor |  |  |  | pF |

*An "LSB" as used here has a value of approximately 5 mV .
NOTES:

1. These values are expected for most parts at $25^{\circ} \mathrm{C}$, but are not tested or guaranteed.
2. DC to 100 KHz .
3. Multiplexer break-before-make is guaranteed.
4. Resistance from device pin, through internal MUX, to sample capacitor.
5. All conversions performed with processor in IDLE mode.

## 8-BIT MODE A/D OPERATING CONDITIONS

| Symbol | Description | Min | Max | Units |
| :--- | :--- | :---: | :---: | :---: |
| $\mathrm{T}_{\mathrm{A}}$ | Ambient Temperature | -40 | +125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\mathrm{CC}}$ | Digital Supply Voltage | 4.50 | 5.50 | V |
| $\mathrm{~V}_{\text {REF }}$ | Analog Supply Voltage | 4.50 | 5.50 | $\mathrm{~V}(1)$ |
| $\mathrm{T}_{\text {SAM }}$ | Sample Time | 2.0 |  | $\mu \mathrm{~s}(2)$ |
| $\mathrm{T}_{\text {CONV }}$ | Conversion Time | 12 | 15 | $\mu \mathrm{~s}(2)$ |
| F OSC | Oscillator Frequency | 4.0 | 16.0 | MHz |

## NOTES:

1. $\mathrm{V}_{\text {REF }}$ must be within 0.5 V of $\mathrm{V}_{\mathrm{CC}}$.
2. The value of AD_TIME is selected to meet these specifications.

## 8-BIT MODE A/D CHARACTERISTICS (Using Above Operating Conditions)(6)

| Parameter | Typ*(1) | Min | Max | Units* |
| :---: | :---: | :---: | :---: | :---: |
| Resolution |  | $\begin{gathered} 256 \\ 8 \end{gathered}$ | $\begin{gathered} 256 \\ 8 \end{gathered}$ | Level Bits |
| Absolute Error |  | 0 | $\pm 1.0$ | LSBs |
| Full Scale Error | $\pm 0.5$ |  |  | LSBs |
| Zero Offset Error | $\pm 0.5$ |  |  | LSBs |
| Non-Linearity |  | 0 | $\pm 1.0$ | LSBs |
| Differential Non-Linearity |  | -0.5 | +0.5 | LSBs |
| Channel-to-Channel Matching |  | 0 | $\pm 1.0$ | LSBs |
| Repeatability | $\pm 0.25$ | 0 |  | LSBs(1) |
| Temperature Coefficients: <br> Offset <br> Full Scale Differential Non-Linearity | $\begin{aligned} & 0.003 \\ & 0.003 \\ & 0.003 \end{aligned}$ |  |  | LSB/C(1) LSB/C(1) LSB/C(1) |
| Off Isolation |  | -60 |  | $\mathrm{dB}(1,2,3)$ |
| Feedthrough | -60 |  |  | $\mathrm{dB}(1,2)$ |
| $\mathrm{V}_{\text {CC }}$ Power Supply Rejection | -60 |  |  | $\mathrm{dB}{ }^{(1,2)}$ |
| Input Resistance |  | 750 | 1.2K | $\Omega(4)$ |
| DC Input Leakage | $\pm 1.0$ | 0 | $\pm 1.5$ | $\mu \mathrm{A}$ |
| Voltage on Analog Input Pin |  | ANGND - 0.5 | $\mathrm{V}_{\text {REF }}+0.5$ | V (5) |
| Sampling Capacitor | 3.0 |  |  | pF |

*An "LSB" as used here has a value of approximately 20 mV .

## NOTES:

1. These values are expected for most parts at $25^{\circ} \mathrm{C}$, but are not tested or guaranteed
2. DC to 100 KHz .
3. Multiplexer break-before-make is guaranteed
4. Resistance from device pin, through internal MUX, to sample capacitor.
5. Applying voltage beyond these specifications will degrade the accuracy of other channels being converted.
6. All conversions performed with processor in IDLE mode.

## 87C196KT/87C196KS

## 87C196KT/KS ERRATA

The following is a list of all known functional deviations for 87C196KT/KS devices. B-step and later devices can be identified by a special mark following the eight digit FPO number on the top of the package. For C-step devices, this mark is a " C ".

1. HOLD OR READY DURING DIVIDE; (A-step):

There is a bug in the DIV and DIVB (signed divide) instructions such that if the following 2 conditions are met, there may be an error of 1 in the quotient:
a) HOLD or READY is asserted during the first state of execution of the DIV and DIVB instruction.
b) HOLD or READY duration is 16 state times for the DIVB or 24 state times for a DIV instruction.
2. P2.7 (CLKOUT); (A-step):

Port 2.7 (CLKOUT) does not operate in open drain mode.
3. P2__REG. 7 AND P6__REG. 4 THROUGH P6__ REG. 7 CLEARED: (A-step):
P2__REG. 7 is cleared when P2__SSEL. 7 bit is changed from a 1 to a 0 (special function to LSIO). P6__Reg.4-. 7 is cleared when the corresponding P6__SSEL.4-. 7 is changed from a 1 to a 0 .
4. INDIRECT SHIFT INSTRUCTION; (A-step):

The upper three bits of the byte register holding the shift count are not masked completely. If the shift count register has the value $32 \times n$, where $n$ $=1,3,5$ or 7 , the operand wil be shifted 32 times. The above condition results in NO shift taking place.
5. INTERNAL RAM POWERDOWN LEAKAGE; (A-step):
If an invalid address is applied to the internal RAM during power-down, the address lines float. This can cause increased current consumption during power-down. To insure a valid address on the internal RAM, execute the idle/power-down instruction from internal RAM.
6. INST PIN; (A-step):

On A-step devices, the INST pin is pulled medium low for approx. 200 ns after RESET and then pulled weakly HIGH until P5SSEL is written to. This is corrected on B-step devices where the INST pin is pulled medium low for approx. 200 ns after RESET and is then pulled weakly LOW until P5SSEL is written to.
7. REGISTER RAM OVERWRITE; (A-step, B-step):
If a write is performed to a byte/word location within the SFR range of 1 F60h to 1FFFh, the data to be written is also written to a correspondding location located within the REGISTER RAM space 360h to 3FFh. To determine the address of the REGISTER RAM location that is overwritten, an offset of 1C00h can be subtracted from the byte/word addressed in the SFR range.
8. BUS TIMING MODES 1 AND 2 (A-step, B-step): Bus timing modes 1 and 2 are not featured or specified on A-step and B-step parts. On C-step parts Mode 1 is selected by setting bits MSEL1 $=0$ and MSELO $=1$ in the CCB1 register. Mode 2 is similarly selected by setting MSEL1 $=$ 1 and MSELO $=0$. Timings are altered by Mode 1 and Mode 2 as follows (for actual values see the Bus Mode 1 and Bus Mode 2 AC Characteristics in this data sheet):
Mode 1: $\overline{\mathrm{RD}}, \overline{\mathrm{WR}}$ advanced 1 TOSC
ALE advanced 0.5 TOSC
ALE pulse width remains 1 TOSC
Mode 2: $\overline{\mathrm{RD}}, \overline{\mathrm{WR}}$ advanced 1 TOSC
ALE advanced 0.5 TOSC
ALE pulse width remains 1 TOSC
Address advanced 0.5 TOSC
9. $\mathbf{V}_{\mathrm{OH} 2}$ (A-step, b-step):

A- and B-step parts are capable of $\mathrm{V}_{\mathrm{OH} 2}=\mathrm{V}_{\mathrm{CC}}$ -1 V with $\mathrm{I}_{\mathrm{OH}}=-6 \mu \mathrm{~A}$. C-step devices meet the target values of $\mathrm{V}_{\mathrm{OH} 2}=\mathrm{V}_{\mathrm{CC}}-1 \mathrm{~V}$ with $\mathrm{I}_{\mathrm{OH}}$ $=-15 \mu \mathrm{~A}$.
10. CLKOUT DURING RESET (A-step, B-step, C-step):
For all steppings of the 87C196KT, the CLKOUT function during RESET (P2.7) differs from the 87C196KR C-step. During RESET on the 87C196KT, CLKOUT does not toggle and remains in the high state. During RESET on the 87C196KR C-step CLKOUT countinues to toggle.

## 87C196KT/KS DESIGN CONSIDERATIONS

1. EPA TIMER RESET/WRITE CONFLICT

If the user writes to the EPA timer at the same time that the timer is reset, it is indeterminate which will take precedence. Users should not write to a timer if using EPA signals to reset it.
2. VALID TIME MATCHES

The timer must increment/decrement to the compare value for a match to occur. A match does not occur if the timer is loaded with a value equal to an EPA compare value. Matches also do not occur if a timer is reset and 0 is the EPA compare value.
3. P6__PIN.4-. 7 NOT UPDATED IMMEDIATELY

Values written to P6__REG are temporarily held in a buffer. If P6__MODE is cleared, the buffer is loaded into P6__REG.x If P6__MODE is set, the value stays in the buffer and is loaded into P6__REG.x when P6__MODE.x is cleared. Since reading P6__REG returns the current value in P6__REG and not the buffer, changes to P6__REG cannot be read until/unless P6__MODE. $x$ is cleared.
4. WRITE CYCLE DURING RESET

If RESET occurs during a write cycle, the contents of the external memory device may be corrupted.
5. INDIRECT SHIFT INSTRUCTION

The upper 3 bits of the byte register holding the shift count are not masked completely. If the shift count register has the value $32 \times \mathrm{n}$, where $\mathrm{n}=1,3,5$, or 7 , the operand will be shifted 32 times. This should have resulted in no shift taking place.
6. PORT 4 ADDRESS BEHAVIOR

For bus timing Modes 1 and 2, specified only on the 87C196KT/KS C-step, Port 4 does not retain the address during the data portion of the bus cycle. Designs using an 8-bit external memory system in bus Mode 1 or Mode 2 require an external latch on Port 4 to retain the address during the data portion of the bus cycle. Designs using an 8-bit external memory system in the KR or $K R+1$ Wait bus timing modes do not require an external latch. Designs using 16-bit external memory systems require an external latch on both Port 3 and Port 4 in all bus timing modes.

## DATA SHEET REVISION HISTORY

This is the -007 revision of the 8 XC196KT/KS Data Sheet. The following differences exist between the -006 revision and the -007 revision.

1. $\mathrm{V}_{\mathrm{OL} 3}$ estimate added.
2. "Voltage on Analog Input Pin" removed.

Parameter covered by Note 1: $\mathrm{V}_{\text {REF }}$ must be within 0.5 V of $\mathrm{V}_{\mathrm{CC}}$.
3. The Data Sheet Revision History was updated to reflect changes made for this version of the datasheet (-007).
