DDX－2100

## All－Digital High Efficiency Power Amplifier <br> GENERAL DESCRIPTION

## FEATURES

－HIGH OUTPUT CAPABILITY
－ $2 \times \mathbf{5 0 W}$ into $8 \Omega$ or $\mathbf{1 \times 1 0 0 W}$ into $4 \Omega$
－SINGLE SUPPLY（＋9V to +36 V ）
－SMALL PACKAGE
－HIGH EFFICIENCY，＞88\％
－THERMAL OVERLOAD AND SHORT CIRCUIT PROTECTION

## BENEFITS

－COMPLETE SURFACE MOUNT DESIGN
－POWER SUPPLY SAVINGS

## APPLICATIONS

－DIGITAL POWERED SPEAKERS
－PC SOUND CARDS
－CAR AUDIO
－SURROUND SOUND SYSTEMS
－DIGITAL AUDIO COMPONENTS

The DDX－2100 power device is a monolithic dual channel H－Bridge that can provide up to 50 watts per channel of audio power at very high efficiency． The DDX－2100 power device contains a logic interface，integrated bridge drivers，high efficiency MOSFET output transistors and protection circuitry．The device may be used as a dual bridge or reconfigured as a single bridge with double the output current capability．

The benefits of the DDX amplification system are an all－digital design that eliminates the need for a digital to analog converter（DAC）and the high efficiency operation derived from the use of Apogee＇s patented damped ternary pulse width modulation（PWM）．This approach provides an efficiency advantage over conventional Class－D designs and up to three times the efficiency of typical Class A／B amplifiers with music input signals．

Figure 1．Block Diagram

# Absolute Maximum Ratings [Note 1] 

| SYMBOL | PARAMETER | VALUE | UNIT |
| :--- | :--- | :---: | :---: |
| VCC | Power supply voltage | 40 V | V |
| VL | Input logic reference | 5.5 V | V |
| Tj | Operating junction temperature range | -40 to +150 | ${ }^{\circ} \mathrm{C}$ |
| Tstg | Storage temperature range | -40 to +150 | ${ }^{\circ} \mathrm{C}$ |

## Recommended Operating Conditions [Note 2]

| SYMBOL | PARAMETER | MIN | TYP | MAX | UNIT |
| :--- | :--- | :---: | :---: | :---: | :---: |
| VCC | Power supply voltage | 10.0 |  | 36.0 | V |
| VL | Input logic reference | 2.7 | 3.3 | 5.0 | V |
| $\mathrm{T}_{\mathrm{A}}$ | Ambient Temperature | 0 |  | 70 | ${ }^{\circ} \mathrm{C}$ |

Thermal Data

| SYMBOL | PARAMETER | MIN | TYP | MAX | UNIT |
| :--- | :--- | :---: | :---: | :---: | :---: |
| $\theta_{\mathrm{JC}}$ | Thermal resistance junction-case (thermal pad) |  |  | 2.5 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{T}_{\mathrm{jSD}}$ | Thermal shut-down junction temperature |  | 150 |  | ${ }^{\circ} \mathrm{C}$ |
| Twarn | Thermal warning temperature |  | 130 |  | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {hSD }}$ | Thermal shut-down hysteresis |  | 25 |  | ${ }^{\circ} \mathrm{C}$ |

## Electrical Characteristics

Refer to circuit Figure 2. $\mathrm{VCC}=36 \mathrm{~V}, \mathrm{~V}_{\mathrm{L}}=3.3 \mathrm{~V}$, fsw $=384 \mathrm{kHz}, \mathrm{T}_{\mathrm{A}}=25 \mathrm{C}, \mathrm{RL}=8 \Omega$ unless otherwise specified.

| SYMBOL | PARAMETER | CONDITION | MIN | TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Po | Output power [Note 3] | THD+N <1\% |  | 50 |  | Wrms |
| Po | Output power [Note 3] | THD+N < 10\% |  | 75 |  | Wrms |
| UVL | Undervoltage Lockout Threshold |  |  | 7 | 9 | V |
| IPD | Vcc supply current in Powerdown |  |  | 1 | 3 | mA |
| $\mathrm{I}_{\text {cct }}$ tri | Supply current from Vcc in Tristate | TRISTATE = 0 |  | 25 |  | mA |
| $\mathrm{I}_{\mathrm{cc}}$ | Vcc supply current | 2-Chan. switching at 384 KHz . |  | 75 |  | mA |
| $\mathrm{I}_{\mathrm{sc}}$ | Output Short-circuit Protection limit | Speaker outputs. | 3.5 | 5.0 | 6.5 | A |

## Electrical Characteristics (continued)

Note 1: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
Note 2: Performance not guaranteed beyond recommended operating conditions.
Note 3: Characteristics are for the DDX-2100 power device driven by DDX-2000 processor.

## Logic Truth Table

| TRISTATE | INxA | INxB | OUTPx | OUTNx | OUTPUT MODE |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | $X$ | $X$ | OFF | OFF | Hi-Z |
| 1 | 0 | 0 | GND | GND | DAMPED |
| 1 | 0 | 1 | GND | VCC | NEGATIVE |
| 1 | 1 | 0 | VCC | GND | POSITIVE |
| 1 | 1 | 1 | VCC | VCC | Not Used |

## DDX-2100 Pin Function Description

PWM Inputs

| Pin Name | Pin No. | Description |
| :--- | :---: | :--- |
| INLA | 29 | Left A logic input signal |
| INLB | 30 | Left B logic input signal |
| INRA | 31 | Right A logic input signal |
| INRB | 32 | Right B logic input signal |

Control/Miscellaneous

| Pin Name | Pin No. | Description |  |
| :--- | :---: | :--- | :--- |
| PWRDN | 25 | Power Down (0=Shutdown, 1= Normal). |  |
| TRI-STATE | 26 | Tri-State (0=All MOSFETS Hi-Z, 1=Normal). |  |
| FAULT [Note 4] | 27 | Fault output indicator; Overcurrent Overtemperature <br> $1=$ Normal). |  |
| TWARN [Note 4] | 28 | Thermal warning output <br> $\left(0=\right.$ Warning $T_{J}>=130^{\circ} \mathrm{C}, 1=$ Normal).. <br> CONFIG [Note 5] <br> NC 24 | Configuration (0=Normal, 1=Parallel operation for mono). |

Power Outputs [Note 6]

| Pin Name | Pin No. | Description |
| :--- | :---: | :--- |
| OUTPL | 16,17 | Left output, positive reference |
| OUTNL | 10,11 | Left output, negative reference |
| OUTPR | 8,9 | Right output, positive reference |
| OUTNR | 2,3 | Right output, negative reference |

Note 4: FAULT and TWARN outputs are open-drain
Note 5: Connect CONFIG Pin 24 to VREG1 Pins 21,22 to implement single bridge operation for high current.
Note 6: DDX outputs are bridged. The outputs OUTPx produce signals in phase with the input.

## Power Supplies

| Pin Name | Pin No. | Description |
| :--- | :--- | :--- |
| VCC [1P, 1N, 2P, 2N] | $4,7,12,15$ | Power |
| PGND [1P, 1N, 2P, 2N] | $5,6,13,14$ | Power grounds |
| VREG1 | 21,22 | Internal regulator voltage requires bypass capacitor. |
| VREG2 | 33,34 | Internal regulator voltage requires bypass capacitor. |
| VSIG | 35,36 | Signal Positive supply. |
| VL | 23 | Logic reference voltage. |
| GNDREF | 19 | Logic reference ground. |
| GNDS | 1 | Substrate ground. |
| GNDR1 | 20 | Internal regulator ground. |

## DDX-2100 POWER DEVICE

The DDX-2100 Power Device is a dual channel H-Bridge that can deliver over 50 watts per channel of audio output power at very high efficiency. It converts DDX controlled PWM signals to power at the load. The DDX-2100 includes a logic interface, integrated bridge drivers, high efficiency MOSFET outputs, thermal and short circuit protection circuitry. Two logic level signals per channel are used to control highspeed MOSFET switches to connect the speaker load to the input supply or to ground in a bridge configuration, according to Apogee's patented damped ternary PWM. The DDX-2100 includes over-current, thermal and under-voltage lockout with automatic recovery. A thermal warning status is also provided.

Figure 4. DDX-2100 Block Diagram

## Logic Interface and Decode

The DDX-2100 power outputs are controlled using two logic level timing signals. In order to provide a proper logic interface, the VL input must operate at the same voltage as the DDX controller logic supply.

## Protection Circuitry

The DDX-2100 includes protection circuitry for over-current and thermal overload conditions. A thermal warning pin TWARN is activated low (open-drain MOSFET) when the IC temperature exceeds $130^{\circ} \mathrm{C}$, in advance of the thermal shutdown protection. When a fault condition is detected (logical OR of over-current and thermal), an internal fault signal acts to immediately disable the output power MOSFETs, placing both H bridges in a high impedance state. At the same time an open-drain MOSFET connected to the FAULT pin is switched on. There are two possible modes subsequent to activating a fault. The first
is a SHUTDOWN mode. With FAULT (pull-up resistor) and TRI-STATE pins independent, an activated fault will disable the device, signaling low at the FAULT output. The device may subsequently be reset to normal operation by toggling the TRI-STATE pin from High to Low to High using an external logic signal. The second is an AUTOMATIC recovery mode. This is depicted in the application circuit, Figure 2. The FAULT and TRI-STATE pins are shorted together and connected to a time constant circuit comprising RT and CT. An activated FAULT will force a reset on the TRI-STATE pin causing normal operation to resume following a delay determined by the time constant of the circuit. If the fault condition is still presented, the circuit operation will continue repeating until such time as the fault condition is removed. An increase in the time constant of the circuit will produce a longer recovery interval. Care must be taken in the overall system design so as not to exceed the protection thresholds under normal operation.

## Power Outputs

The DDX-2100 power and output pins are duplicated to provide a low impedance path for the devices bridged outputs. All duplicate power, ground and output pins must be connected for proper operation. The PWRDN or TRI-STATE pins should be used to set all MOSFETS to the Hi-Z state during power-up until the logic power supply, VL, is settled.

## Parallel Output/High Current Operation

The DDX-2100 outputs can be connected in parallel to increase the output current to a load. In this configuration the device can provide over 100 W into $4 \Omega$ (see Figure 3). This mode is enabled with the CONFIG pin connected to VREG1 and the inputs combined INLA $=$ INLB, INRA = INRB and outputs combined OUTLA = OUTLB, OUTRA = OUTRB.

## ADDITIONAL INFORMATION

## Output Filter

A passive two-pole low pass filter is used on the DDX-2100 power outputs to reconstruct an analog signal. System performance can be significantly affected by the output filter design and choice of components. A filter design for $8 \Omega$ loads is shown in Figure 2, and for $4 \Omega$ loads in Figure 3.

## Power Dissipation/Heat Sink

## Requirements

The power dissipation of the device will depend primarily on the supply voltage, load impedance, and output modulation level.

The DDX-2100 surface mount package includes an exposed thermal pad on the top of the device to provide a direct thermal path from the integrated circuit to the heatsink. This pad should be fastened to a low thermal impedance path at circuit ground potential for proper operation.. For continuous duty rated applications, careful consideration must be made to the overall thermal design.

For additional thermal design considerations, see http://www.apogeeddx.com/DDX_Themal_Consid erations.PDF
