DESCRIPTION

These devices consist of two independent low voltage comparators designed specifically to operate from a single supply over a wide range of voltages. Operation from split power supplies is also possible.

These comparators also have a unique characteristic in that the input common-mode voltage range includes ground even though operated from a single power supply voltage.

All the pins are protected against electrostatic discharge up to 2kV. As a consequence, the input voltages must not exceed the magnitude of V_{CC+} or V_{CC-} .

1. Short-circuits from the output to V_{CC}^+ can cause excessive heating and eventual destruction. The maximum output current is approximately 20mA independent of the magnitude of V_{CC}^+ .

I_{OH}	High Level Output Current ($V_{id} = 1V$) $V_{id} = 1V$, $V_{CC} = V_o = 30V$ $T_{amb} = +25^\circ C$ $T_{min} \leq T_{amb} \leq T_{max}$		0.1	1	nA µA
t_{re}	Response Time - note ⁵⁾ $R_L = 5.1k\Omega$ to V_{CC^+}		1.3		µs
t_{rel}	Large Signal Response Time $V_i = TTL$, $V_{(ref)} = +1.4V$, $R_L = 5.1k\Omega$ to V_{CC^+}		300		ns

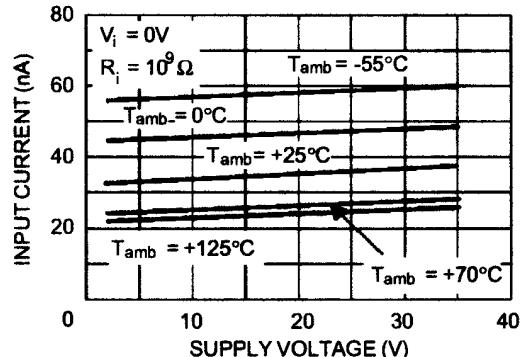

- At output switch point, $V_o \approx 1.4V$, $R_s = 0$ with V_{CC^+} from 5V to 30V, and over the full common-mode range (0V to $V_{CC^+} - 1.5V$).
- The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output, so no loading charge exists on the reference of input lines.
- The input common-mode voltage of either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common-mode voltage range is $V_{CC^+} - 1.5V$, but either or both inputs can go to +30V without damage.
- Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common-mode range, the comparator will provide a proper output state. The low input voltage state must not be less than -0.3V (or 0.3V below the negative power supply, if used).
- The response time specified is for a 100mV input step with 5mV overdrive. For larger overdrive signals 300ns can be obtained
