#### 1. Feature

ROM: 1K x 14 bits RAM: 33 x 8 bits STACK: 4 Levels

I/O ports: 12 I/O PAD

Timer/counter: 8bits x1 (TMR0)

Prescaler: 8 Bits

Two IRQ sources: Internal IRQ: (TMR0)

External IRQ: (PA<sub>0</sub>)

Watchdog Timer: On chip WDT is based on internal RC oscillator. The shortest period is

20mS; user can extend the WDT overflow period to 2.6S by using

prescaler.

Power-On Reset & Power-Down Reset

Reset Timer: 20 mS (5V)

Four external Oscillate modes: RC,LP Crystal,NT Crystal and HS Crystal.

Two operation modes: General mode, and Advanced mode

Operation Voltage: 2.2V~5.5V

Instruction set: 79

Wake-up: Watchdog timer overflow, Port A (PA<sub>3</sub>~PA<sub>0</sub>)

Reset vector: 3FFH IRQ vector: 3FEH

Low voltage reset: voltage shortage will result in reset

### 2. Pin Definition & Pad Assignment

### 4. System Block Diagram

### 5. Memory Map

TM58P10 memory is organized into program memory and data memory.

#### 5.1 Program memory

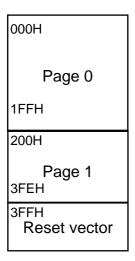

TM58P10 provides 2 program memory maps, general mode and advanced mode. User can select different mode by setting configure word.

In general mode, there are only 512 words of the same page that can be directly addressed. Extra program memory can be addressed by setting bit 5 of status register. The sequence of instructions is controlled via the program counter (PC), which automatically increases 1. However, the sequence can be changed by skip, call and goto instructions or by moving data to the PC.

In advanced mode, TM58P10 allow directly goto any address in 1K memories without limited by page size. In addition, Icall and Igoto instructions are employed to provide flexible addressing mode.

TM58P10 has a 10-bits program counter capable of accessing 1K spaces. If accessing address has over 1K, then the address will map to physical 1K memories, i.e. 1K+M will be mapped to M. A NOP at the reset vector location will cause a restart at address 000h. A simple map to induce illustrate ROM organization is shown in figures 5-1.

#### **General Mode**

#### **Advanced Mode**

Figure 5-1 The ROM Organization

TM58P10 only provide IRQ function in advanced mode. In this mode, the address 3FEH is reserved for IRQ vector. User can operate advanced mode by setting configuration word. The configuration word is located 800H that contains OSC selection, WDT enable, code protection; operate type selection and low voltage reset selection.

Bit	Symbol		Description									
		Bit₁	Bit <sub>0</sub>	OSC Type	Resonance Frequency							
		0	0	LP (low speed)	32~200K hz							
1~0	FOSC <sub>1</sub> ~FOSC <sub>0</sub>	0	1	NT <sub>(Normal speed)</sub>	200K~10M hz							
		1	0	HS (high speed)	10~20M hz							
		1	1	RC	32K ~ 6M hz							
2	WDTE	1	/DTE: Watchdog enable/disable control 1: WDT enable 0: WDT disable

6~5	LV1~LV0	0	1	Ī	Don't use							
		1	0		2V							
		0	0		4V							

Figure 5-2 The Configuration Word

#### 5.2 Data memory

Data memory is composed of special function registers and general-purpose ram. The size of data memory is not stationary, it depends on bit 4 of configuration word (general or advanced mode).

#### 5.2.1 General Mode

In general mode, TM58P10 has 25 general-purpose registers that accessed by using a bank select scheme. The special function registers include the program counter (PC), the timer (TMR0) register, the status register, the bank select register, and the I/O port registers. Furthermore, TM58P10 has 3 auxiliary registers that include indirect addressing register (IAR), the select register (Select) and the I/O direction register (IODIR). The register map of general mode is shown in figure 5-3.

	Bank₀
00h	IAR
01h	TMR0
02h	PC
03h	STATUS
04h	BSR
05h	PORTA
06h	PORTB
9+16=25	General Purpose Register 07 – 0F
9+10=25	General Purpose Register 10 -1F

Figure 5-3 The Register Map of General Mode

- A. The IAR (indirect addressing register) is not a physical register and is used to assist BSR with indirect addressing. Any instruction attempts to access IAR actually mapping to another address that is pointed by BSR. Since IAR is not a material circuit, user reads IAR itself (BSR=00H) will always return 00h at data bus. Writing to IAR itself will like NOP.
- B. Select register is used to control WDT and TMR<sub>0</sub>. It has not assigned a specific address in data memory and can only set control bits by "select" instruction, i.e. it is write-only register. The context of accumulator will be sent to the select register by executing the "select" instruction. If select register has never set by program, its default value is 3FH. We drew Figure 5-4 to explain how to set select register.

Bit	Symbol		Description									
		PS <sub>2</sub>	PS <sub>1</sub>	PS <sub>0</sub>	TMR0 rate	WDT rate						
		0	0	0	1:2	1:1						
		0	0	1	1:4	1:2

		EDGE	o: TMR	0 sour	ce signal edge contro	ol bit						
4	EDGE <sub>0</sub>	1:in	cremer	nt wher	$H \!\!  o \! L$ transition on $G$	external clock						
		0:in	cremer	nt wher	$h \to H$ transition on $e$	external clock						
		SUR <sub>0</sub> :	TMR0	clock s	source bit							
5	SURo	1: E	xterna	l clock	input							
		0: (I	nterna	l clock)	/4 or internal instruct	ion cycle						

Figure 5-4 Select Register

- C. The I/O Direction control register is similar to the Select register that is write-only register. To set an I/O port pin as input, the corresponding direction control bit must be high. Similarly, the zero represents output. Any direction control bit can be programmed individually as input or output by using IODIR instruction. If the register is not programmed, than all I/O ports always keep input mode.
- PC (program counter) is a 10-bit wide binary counter and increases itself for every instruction cycle, except the following instructions.
  - 1. call, goto, Igoto and Icall: the label will move to PC
  - 2. retla, reti and ret: the top value of stack will pop to PC
- Incrementing PC when it changes to the next higher page. It should be noted that the page select bits in the status register would not be changed synchronously. The following Goto, Call, or MOVAM 02H will return to the previous page, unless the page select bits have been updated in program. In order to reduce the complexity of programming, TM58p10 provides 2 instructions to facilitate subroutine call and branch handling which are LCALL and LGOTO. LCALL and LGOTO can address to anywhere in the ROM, but the page select bits are unnecessary. The attached operands of CALL and GOTO are 8-bit and 9-bit respectively, and so need extra bits (page select bits) to address whole memory. However, LCALL and LGOTO have 10-bit wide operands that are easy to address the total ROM space.
- TMR0 is 8-bit wide binary counter/timer. This register increases by an external signal edge applied to RTCC pin, or by internal instruction cycle. It has the following features.
  - A. Readable and writeable
  - B. Synchronize with 2 internal clocks
  - C. Can use programmable prescaler by setting select register The other details will be described in follow-up chapter.
- Status register contains page select bits, time out bit, power down bit and the status of ALU. Please note that TOB and PDB are controlled by hardware and unchangeable by program.

Bit	Symbol	Description								
		Car	rry and Borrow bit							
	0 C	ADD instruction	SUB instruction							
0		1: a carry occurred from the 0: no carry	MSB 1: no borrow (Note1) 0: a borrow occurred from the MSB

Figure 5-5-1

Note2: The  $\overline{TO}$  and  $\overline{PD}$  bits are active low that can be used to determine different causes of reset. The Figure 5-5-2 illustrates the value of  $\overline{TO}$  and  $\overline{PD}$  after the relative reset events.

$\overline{TO}$	$\overline{PD}$	Reset Event				
0	0	WDT time out from sleep mode				
0	1	WDT time out from normal mode				
1	0	Input a 'low" at RESETB from sleep mode				
1	1	Power on reset				
Unchanged	Unchanged	Input a "low" at RESETB from normal mode				

Figure 5-5-2

BSR (bank select register) is associated with IAR to indirectly access the data memory. The BSR<4:0> bits are used to select data memory addresses 00h to 1Fh (Bank<sub>0</sub>). The addressing map is shown in Figure 5-6.

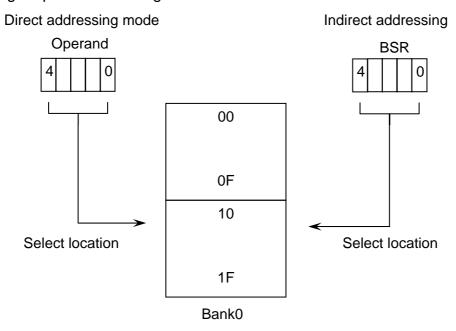

Figure 5-6 The Direct and Indirect Addressing Map

 Port A~B are programmable I/O ports. Please note that read I/O instruction always read the I/O pin even though the pin is output mode. On reset, all I/O pins were set as input mode until IODIR has been changed.

#### 5.2.2 The advanced mode

In advanced mode, we provide IRQ, convenient wake up functions and flexible addressing mode. In addition to extend data memory, we increase 3 extra registers to support IRQ and wake\_up. This section will introduce these increased control registers and characteristics. The data memory map of advanced mode and the addressing map are shown in figure 5-7 and figure 5-8 respectively.

#### Advanced mode (Type=1)

Navanosa modo (1900-1)								
	00~1F	20~3F						
00h	IAR	WAKE_UP						
01h	TMR0	IRQM						
02h	PC	IRQF						
03h	STATUS							
04h	BSR	Unimplemented						
05h	PORTA	Unimplemented						
06h	PORTB							
	General Purpose Register 07-0F	General Purpose Register 28-2F						
17+16=33	General Purpose Register 10-1F	Unimplemented						

Figure 5-7 The Data Memory Map of Advanced Mode

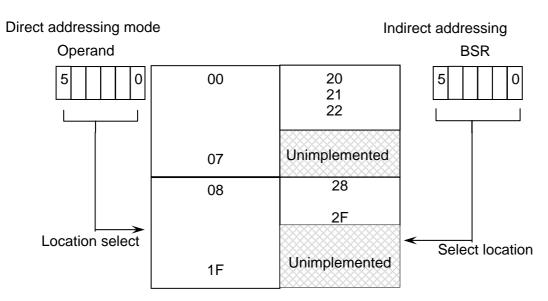

Figure 5-8 The Direct and Indirect Addressing Map

In advanced mode, we locate the increased 8 general-purpose registers on 28~2F which shown in Fig 5-7. The IRQ and the Wake\_up control registers (WAKE\_UP, IRQM and IRQF) are assigned to 20, 21 and 22, respectively. In advanced mode,TM58P10 allows 7-bit wide operand to access ram, operand<4:0> can address 00~3F directly. It doesn't need bank select bits, and reduces the complexity of programming.

• The wake up control register (WAKE\_UP) is used to set watchdog enable and distinguish between external wake-up signal and IRQ. On reset, all bits are defined as "0" that can be programming by software. The scheme of WAKE\_UP register is shown in Fig 5-9.

Bit	Symbol	Description
7	WDTS	Watch Dog Timer Software Control bit: TM58P10 has 2 WDT control bits (WDTE and WDTS), WDTE is set in configuration word by hardware and WDTS is set in control register by software. If WDTS is valid only if WDTE has been set, i.e. WDTE has higher priority than WDTS.  1: enable 0: disable
6	WUE	Wake Up Enable bit: 0: don't support external wake-up 1: enable external wake-up function
5	EIS	External Interrupt Select:  1: set PA <sub>0</sub> as an external IRQ pin (Note3)  0: set PA <sub>0</sub> as a bi-directional I/O pin
4		Unimplemented
3~1	PUH3~PUH1	Pull High Port A bit3 ~1:  0: disable external wake up  1: if (WUE) & (PUH <sub>N</sub> ) & (input a falling edge signal at PA <sub>N</sub> ) then wake up chip from sleep. N can be 3, 2 or 1, but it must keep consistent.
0	PUH <sub>0</sub>	Pull High Port A bito:  0: disable external wake up and external IRQ  1: if (WUE) & (PUH <sub>0</sub> ) & (input a falling edge signal at PA <sub>0</sub> ) then wake up chip from sleep.  Or if (EIS) & (PUH <sub>0</sub> ) & (input a falling edge signal at PA <sub>0</sub> ) then generate an IRQ.  Note: If PUH <sub>0</sub> , WUE and EIS are set as '1', then PA <sub>0</sub> is defined as IRQ input pin.

Figure 5-9 The Scheme of Wake\_Up Register

Note3: The IRQ must execute at normal mode. If an IRQ is occurred at sleep model, then the IRQ routine will be performed until this chip has woken by external wake up signal. Other wake methods include (1) power on reset, (2) external reset and (3) WDT overflow (if enabled), the foregoing cases mean the IRQ ought to be abolished.

 The Interrupt Mask register and Interrupt Flag register are used to control IRQ handling. TM58P10 supports TMR0 and external interrupt but nest-interrupt is not allowed. The schemes of the interrupt mask register and the interrupt flag register are shown in Fig 5-10 and 5-11, respectively.

Bit	Symbol	Description
7	INTM	Global enable bit: The bit has higher priority than EXINTM and TMR0M. 1: enable 0: disable By the way, the RETI instruction will set INTM as '1'.
6~3		Unimplemented
2	EXINTM	External Interrupt enable: 1:Enable Interrupt 0:Disable Interrupt
1		Unimplemented
0	TMR0M	TMR0 Interrupt enable: 1:Enable Interrupt 0:Disable Interrupt

Figure 5-10 Interrupt Mask register

Bit	Symbol	Description
7~3		Unimplemented
2	EXINTF	External interrupt flag:  1: the External interrupt be requested by the external interface (Port A <sub>0</sub> ) (Note4)
1		Unimplemented
0	TMR0F	TMR0 interrupt flag: 1: The TMR0 counter overflow generates an interrupt request.

Figure 5-11 Interrupt Flag register

Note 4: Both interrupt flags are set by hardware; software can only clear flags. It is useless that attempt writing '1' to flag.

The debounce time is the interval that must pass before a second pressing of a key is accepted. User can set this interval with the delay routine (See Example 1).

#### Key bounce

```
interrup
  btmss irqf,2 ;; if external IRQ?
  lgoto int_end
int nt1
                  ;; filter out key begin bounce
  btmsc ra,0
  lgoto int_nt1
int_loop1
               ;; filter out key end bounce
  call delay ;; worse case 30ms

  reti
```

### 6. Functional Description

#### 6.1 TMR0 and Watchdog timer

Fig. 6-1 shows the block diagram of the TMR0/WDT prescaler. As shown in the figure, the prescaler register can be a pre-scaler for TMR0 or be a post-scaler for WDT.

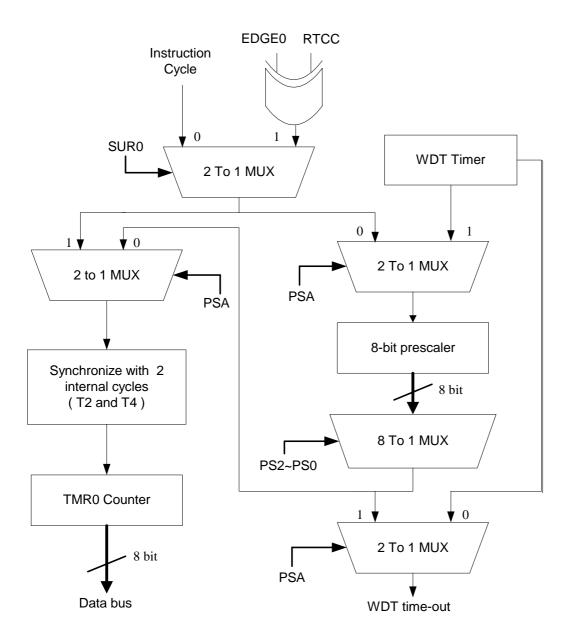

Figure 6-1 Block Diagram of the TMR0/WDT Prescaler

The TMR0 is an 8-bit timer/counter. The clock source of TMR0 can come from the instruction clock or the external clock.

- A. To select the instruction clock, the SUR<sub>0</sub> bit of the select register should be clear. When no prescaler is used, TMR<sub>0</sub> will increase by 1 at every instruction cycle.
- B. To select the external clock, the SUR<sub>0</sub> bit of the select register should be set. In this mode, TMR0 relies on the EDGE<sub>0</sub> bit to determine that TMR0 is increased by 1 at every falling or rising edge. When an external clock is used for TMR0, a problem must be noted that the external clock synchronizes with internal clock. TM58P10 synchronizes external clock by sampling internal clock at T2 and T4. If external pulse is smaller than 2 internal cycles, the pulse maybe ignored. Therefore, the external clock must keep stable state (high or low) for at least 2 internal cycles.

The WDT counter is an 8-bit binary counter. The clock source of WDT is provided by an independent on-chip RC oscillator that does not need any external clock. Therefore, the WDT will keep counting even if the chip has slept already. A WDT time-out will restart system and set the time-out flag bit (bit4 of status register) as "0". The WDT time-out period vary with temperature, power voltage and process. This period can be improved via the prescaler. The maximum division ratio can up to 1:128 by setting PS2~PS0 as "111".

The prescaler can be assigned to either the TMR0 or the WDT via the PSA bit. Note that either WDT or TMR0 can employ the prescaler simultaneously. The following Example(2-3) must be executed when changing PSA form TMR0 to the WDT and form WDT to the TMR0 respectively. These examples can avoid an unintended time-out reset.

Example 2 Changing prescaler form TMR0 to WDT

Example 3 Changing prescaler form WDT to TMR0

When the prescaler is assigned to WDT, "CLRWDT" and "SLEEP" instruction will clear the prescaler and the WDT. When the prescaler is assigned to TMR0, the prescaler will be cleared by any instruction that writes to TMR0.

#### 6.2 Reset

TM58P10 may be reset by one of the following conditions:

- (1) Power-on
- (2) Power-down (circuit protection), refer to electrical characteristic.
- (3) RESETB/VPP pin input a negative pulse
- (4) WDT timer out reset (if enabled).

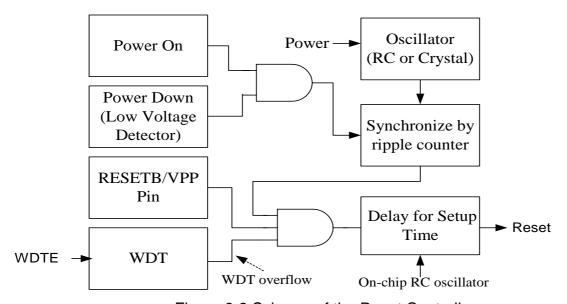

Figure 6-2 Scheme of the Reset Controller

As shown in the figure 6-2, four reset conditions are listed. The power-down event will cause TM58P10 to reset which the voltage ranges is according to the bit6~bit5 in the configuration word. This condition is used to protect chip in deficient power environment. The voltage ranges of power-down are defined in electrical characteristics. Furthermore, the ranges may be influenced by process and temperature variations. In general, we call the first two reset-cases as cold reset. The cold reset time may be too short for slow crystals and RC oscillators that require much longer than setup time (note) to oscillate. In order to insure the system is correct, the events should be synchronized with system clock.

Note: the setup time is approximately 20ms that will affect due to power voltage, process and temperature variations.

The last two cases are called warm reset. The different reset events will affect registers and ram. The  $\overline{TO}$  and  $\overline{PD}$  bits can be used to determine the type of reset. These relation are listed in figure 6-3

Address	Name	Cold Reset	Warm Reset
N/A	Accumulator	xxxx xxxx	pppp pppp

LCALL I	Call subroutine. However, LCALL can addressing 2K address	2	None	01 Oiii iiii iiii
LGOTO I	Go branch to any address	2	None	O1 1iii iiii iiii
MOVAM m	Move data form acc to memory	1	None	10 0000 1MMM MMMM
MOVLA I	Move literal to accumulator	1	None	11 0001 iiii iiii
MOVM M, m	$(M) \rightarrow (M)$	1	Z	10 0011 1MMM MMMM
MOVM M, a	(M) → (acc)	1	Z	10 0011 0MMM MMMM
NOP	No operation	1	None	10 0000 0000 0000
RET	Return	2	None	11 1111 0111 1111
RETI	Return and enable INTM	2	None	11 1111 1111 1111
RETLA I	Return and move literal to accumulator	2	None	11 1100 iiii iiii
RLM M, m	Rotate left from m to itself	1	С	10 1100 1MMM MMMM
RLM M, a	Rotate left from m to acc	1	С	10 1100 0MMM MMMM
RRM M, m	Rotate right from m to itself	1	С	10 1110 1MMM MMMM
RRM M, a	Rotate right from m to acc	1	С	10 1110 0MMM MMMM
SELECT	Set select register	1	None	10 0000 0000 0010
SLEEP	Enter sleep (saving) mode	1	TO, PO	10 0000 0000 0011
SUBAM M, m	(M)–(acc) → (M)	1	C, DC, Z	10 1010 1MMM MMMM
SUBAM M, a	(M) –(acc) → (acc)	1	C, DC, Z	10 1010 0MMM MMMM

SWAPM M, a	Swap data from m to acc	1	None	10 1101 0MMM MMMM
XORAM M, m	(M) xor (acc) → (M)	1	Z	10 1011 1MMM MMMM
XORAM M, a	(M) xor (acc) → (acc)	1	Z	10 1011 0MMM MMMM
XORLA I	Literal xor (acc) → (acc)	1	Z	11 1000 iiii iiii

#### 8. Electrical Characteristics

### **8.1 Absolute Maximum Ratings**

Supply Voltage .... Vss-0.3V to Vss+5.5V Storge Temperature .....  $-50^{\circ}$ C to  $125^{\circ}$ C Input Voltage ..... Vss-0.3V to VDD+0.3V Operating Temperature ....  $0^{\circ}$ C to  $70^{\circ}$ C

#### 8.2 DC Characteristics

Sumb of	Dovernator	Test Conditions		Min.	Тур.	Max.	Unit
Symbol	Parameter	VDD	OD Conditions				
VDD	Operating Voltage			2.2		5.5	V
V <sub>DVT</sub>	Detect Voltage	5V	Low Voltage Detector (Idd = 3uA) Config bit6.bit5=00		4		V
	Detect Voltage	3V	Low Voltage Detector (Idd = 1.5uA) Config bit6.bit5=10		2		٧
V <sub>IH</sub>	Input HighVoltage	5V	I/O Port	2		VDD	V
V <sub>IL</sub>	Input Low Voltage	5V	I/O Port			0.8	٧
	Standby Current	5V	LVD disable, WDT disable		1		uA
I <sub>DD1</sub>	Standby Current	50	LVD disable, WDT enable		10		u_
I <sub>IL</sub>	Input Leakage Current		Vin=VDD, VSS		1		uA
			Voh=4.5V		9		
I <sub>OH</sub>	I/O Port Driving Current	5V	Voh=4V		17		mΑ
	Current		Voh=3.5V		23		
	I/O Dart Cial		Vol=0.5V		20		
I <sub>OL</sub>	I/O Port Sink Current	5V	Vol=01V		35		mA
			Vol=1.5V		50		

#### 8.3 AC Characteristics

		Test Conditions					
Symbol	Parameter	VDD	Conditions	Min	Тур	Max	Unit
f <sub>sys1</sub>	System Clock	5V	LP Crystal mode	32		200	Khz
