

GM6156

150mA LOW - NOISE LDO REGULATOR

Power Management

Description

The GM6156 is an efficient linear voltage regulator with ultralow - noise output, very low dropout voltage (typically 17mV at light loads and 100mV at 50mA), and very low ground current (600 μ A at 100mA output). The GM6156 provides better than 1% initial accuracy.

Designed especially for hand-held, battery-powered devices, the GM6156 includes a CMOS or TTL compatible enable/ shutdown control input. When shutdown, power consumption drops nearly to zero. Regulator ground current increases only slightly in dropout, further prolonging battery life. Key GM6156 features include a reference bypass pin to improve its already excellent low-noise performance, reversed-battery protection, current limiting, and overtemperature shutdown.

The GM6156 is available in SOT-25 package.

Application

Cellular telephones

Laptop, notebook, and palmtop computers

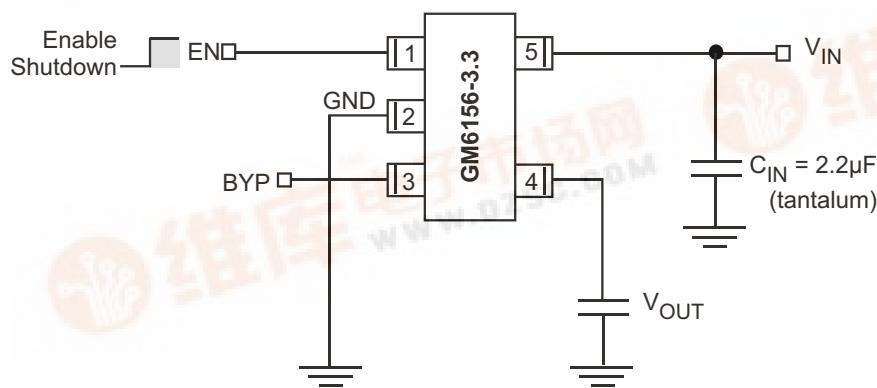

Battery-powered equipment

PCMCIA V_{CC} and V_{PP} regulation/ switching

Features

- ◆ Very low noise output
- ◆ Extremely accurate output voltage
- ◆ Guaranteed 150mA output
- ◆ Low quiescent current
- ◆ Low dropout voltage
- ◆ Extremely tight load and line regulation
- ◆ Very low temperature coefficient
- ◆ Current and thermal limiting
- ◆ Reverse-battery protection
- ◆ "Zero" off-mode current
- ◆ Logic-controlled electronic enable

TYPICAL APPLICATION CIRCUITS

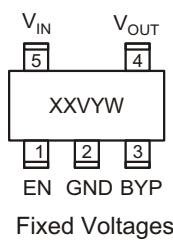

Low-Noise Operation:
 $C_{BYP} = 470\text{pF}$, $C_{OUT} \geq 2.2\mu\text{F}$

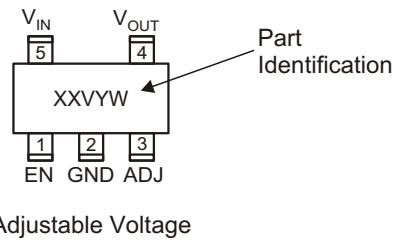

Basic Operation:
 $C_{BYP} = \text{not used}$, $C_{OUT} \geq 1\mu\text{F}$

* For detail Ordering Number identification, please see last page.

◆ PIN DESCRIPTION

Pin Number	Pin Name	Function
1	EN	Enable/ Shutdown(Input): COMS compatible input. Logic high = enable, logic low or open = shutdown.
2	GND	Ground
3	BYP	Reference Bypass: Connect external 470pF capacitor to GND to reduce output noise. May be left open.
4	V _{OUT}	Regulator Output
5	V _{IN}	Supply Input

◆ BLOCK DIAGRAM

	I_{IH}	$V_{IH} \leq 2.0V$	2	5	20 25	μA

Note 1. Exceeding the absolute maximum rating may damage the device.

Note 2. The device is not guaranteed to function outside its operating rating.

Note 3: The maximum allowable power dissipation at any T_A (ambient temperature) is $P_D(\max) = (T_J(\max) - T_A) / \theta_{JA}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown.

Note 4: Output voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature range.

Note 5: Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 0.1mA to 150mA. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

Note 6: Dropout Voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at 1V differential.

↳ the regulator quiescent current plus pass transistor base current. The total current drawn from the supply is the sum of the output current plus the ground pin current.

◆ Applications Information

Enable/ Shutdown

Forcing EN (enable/ shutdown) high (>2V) enables the regulator. EN is compatible with CMOS logic gates. If the enable / shutdown feature is not required, connect EN (pin 1) to IN (supply input, pin 5). See Figure 3.

Input Capacitor

A 1 μ F capacitor should be placed from IN to GND if there is more than 10 inches of wire between the input and the ac filter capacitor or if a battery is used as the input .

Reference Bypass Capacitor

BYP (reference bypass) is connected to the internal voltage reference. A 470pF capacitor (C_{BYP}) connected from BYP to GND quiets this reference, providing a significant reduction in output noise. C_{BYP} reduces the regulator phase margin; when using C_{BYP} , output capacitors of 2.2 μ F or greater are generally required to maintain stability.

The start-up speed of the GM6156 is inversely proportional to the size of the reference bypass capacitor. Applications requiring a slow ramp-up of output voltage should consider larger values of C_{BYP} . Likewise, if rapid turn-on is necessary, consider omitting C_{BYP} .

If output noise is not a major concern, omit C_{BYP} and leave BYP open.

Output Capacitor

An output capacitor is required between OUT and GND to prevent oscillation. The minimum size of the output capacitor is dependent upon whether a reference bypass capacitor is used. 1.0 μ F minimum is recommended when C_{BYP} is not used (see Figure 2). 2.2 μ F minimum is recommended when C_{BYP} is 470pF (see Figure 1). Larger values improve the regulator's transient response. The output capacitor value may be increased without limit.

The output capacitor should have an ESR (effective series resistance) of about 5W or less and a resonant frequency above 1MHz. Ultra-low-ESR capacitors can cause a low amplitude oscillation on the output and/ or underdamped transient response. Most tantalum or aluminum electrolytic capacitors are adequate; film types will work, but are more expensive. Since many aluminum electrolytics have electrolytes that freeze at about -30°C, solid tantalums are recommended for operation below -25°C.

At lower values for output current, less output capacitance is required for output stability. The capacitor can be reduced to 0.47 μ F for current below 10mA or 0.33 μ F for current below 1mA.

No-Load Stability

The GM6156 will remain stable and in regulation with no load (other than the internal voltage divider) unlike many other voltage regulators. This is especially important in CMOS RAM keep-alive applications.

Thermal Considerations

The GM6156 is designed to provide 150mA of continuous current in a very small package. Maximum power dissipation can be calculated based on the output current and the voltage drop across the part. To determine the maximum power dissipation of the package, use the junction-to-ambient thermal resistance of the device and the following basic equation:

$$P_{D(\max)} = \frac{(T_{J(\max)} - T_A)}{R_{JA}}$$

$T_{J(\max)}$ is the maximum junction temperature of the die, 125°C, and T_A is the ambient operating temperature. R_{JA} is layout dependent; Table 1 shows examples of junction-to-ambient thermal resistance for the GM6156.

Parameter	R_{JA} Recommended Minimum Footprint	R_{JA} 1" Square Copper Clad	R_{JC}
SOT-23-5	220°C/ W	170°C/ W	130°C/ W

Table 1. SOT-25 Thermal Resistance

The actual power dissipation of the regulator circuit can be determined using the equation:

$$P_D = (V_{IN} - V_{OUT}) I_{OUT} + V_{IN} I_{GND}$$

Substituting $P_{D(max)}$ for P_D and solving for the operating conditions that are critical to the application will give the maximum operating conditions for the regulator circuit. For example, when operating the GM6156 at room temperature with a minimum footprint layout, the maximum input voltage for a set output current can be determined as follows:

$$P_{D(max)} = \frac{(125^\circ\text{C} - 25^\circ\text{C})}{220^\circ\text{C}/\text{W}}$$

$$P_{D(max)} = 455\text{mW}$$

The junction-to-ambient thermal resistance for the minimum footprint is 220°C/ W, from Table 1. The maximum power dissipation must not be exceeded for proper operation. Using the output voltage of 3.3V and an output current of 150mA, the maximum input voltage can be determined. From the Electrical Characteristics table, the maximum ground current for 150mA output current is 2500μ or 2.5mA.

$$455\text{mW} = (V_{IN} - 3.3\text{V}) 150\text{mA} + V_{IN} \cdot 2.5\text{mA}$$

$$455\text{mW} = V_{IN} \cdot 150\text{mA} - 495\text{mA} + V_{IN} \cdot 2.5\text{mA}$$

$$950\text{mW} = V_{IN} \cdot 152.5\text{mA}$$

$$V_{IN(max)} = 6.23\text{V}$$

Therefore, a 3.3V application at 150mA of output current can accept a maximum input voltage of 6.2V in a SOT-25 package. For a full discussion of heat sinking and thermal effects on voltage regulators.

Fixed Regulator Applications

Figure 3. Ultra-Low-Noise Fixed Voltage Application

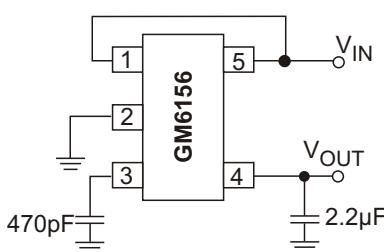

Figure 3 includes a 470pF capacitor for low-noise operation and shows EN (pin 3) connected to IN (pin 1) for an application where enable/ shutdown is not required. $C_{OUT} = 2.2\mu\text{F}$ minimum.

Figure 4. Low-Noise Fixed Voltage Application

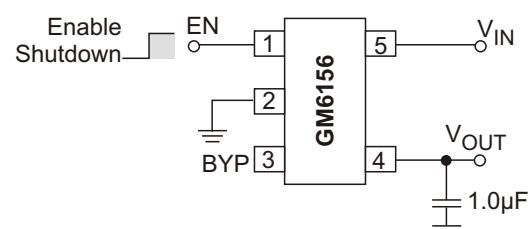

Figure 4 is an example of a low-noise configuration where C_{BYP} is not required. $C_{OUT} = 1\mu\text{F}$ minimum.

Adjustable Regulator Applications

The GM6156 can be adjusted to a specific output voltage by using two external resistors (Figure 5). The resistors set the output voltage based on the following equation:

$$V_{OUT} = 1.242\text{V} \times \left(\frac{R_2}{R_1} + 1 \right)$$

This equation is correct due to the configuration of the bandgap reference. The bandgap voltage is relative to the output, as seen in the block diagram. Traditional regulators normally have the reference voltage relative to ground and have a different V_{OUT} equation.

Resistor values are not critical because ADJ(adjust) has a high input impedance, but for best results use resistors of 470k or less. A capacitor from ADJ to ground provides greatly improved noise performance.

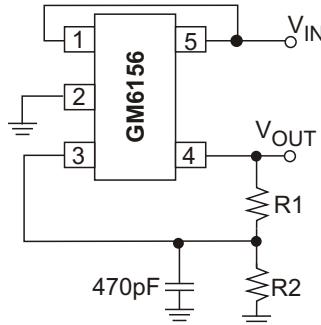

Figure 5. Ultra-Low- Noise Adjustable Voltage Application

Figure 5 includes the optional 470pF noise bypass capacitor from ADJ to GND to reduce output noise.

Dual-Supply Operation

When used in dual supply systems where the regulator load is returned to a negative supply, the output voltage must be diode clamped to ground.
