Zero Drift, Digital Programmable Instrumentation Amplifier

Preliminary Data Sheet

AD8231

FEATURES

Digitally programmable gain
- **G= 1, 2, 4, 8, 16, 32, 64, 128**
- **Software or pin programmable**

Excellent temperature performance
- **Specified from −40°C to +125°C**
- **50 nV/°C max input offset drift**
- **10 ppm/°C max gain drift**

Excellent dc performance
- **122 dB min CMR, G = 128**
- **25 µV max input offset voltage**
- **100 pA max bias current**
- **0.7 uV p-p (0.1 Hz to 10 Hz)**

Good ac performance
- **Gain Bandwidth Product 1 MHz**
- **Slew Rate 0.7 V/µs**

Rail-to-rail input and output
Shutdown/Multiplex
Additional uncommitted op amp
Supply range: 3.0V to 5.5V

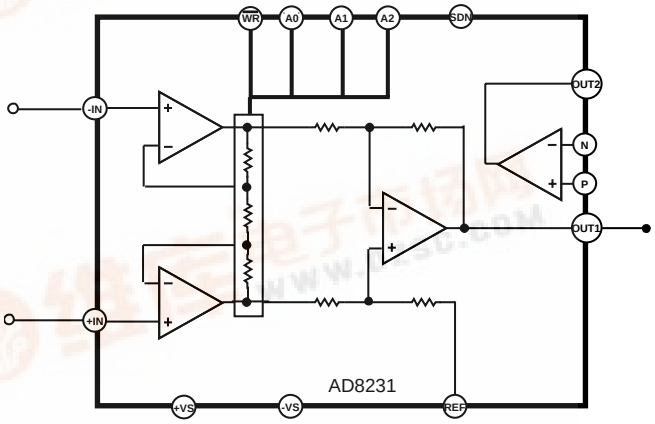

Figure 1. AD8231 Functional Diagram

APPLICATIONS

Pressure and Strain Transducers
Thermocouples and RTDs
Programmable Instrumentation
Industrial Controls
Weigh Scales

GENERAL DESCRIPTION

The AD8231 is a low drift, rail to rail, instrumentation amplifier with software programmable gains of 1, 2, 4, 8, 16, 32, 64 or 128. The gains are programmed via digital logic or pin strapping.

The AD8231 is ideal for applications that require precision performance over a wide temperature range, such as industrial temperature sensing and data logging. Because the gain setting resistors are internal, maximum gain drift is only 10 ppm/°C. Because of the autozero input stage, maximum input offset is 25 uV and maximum input offset drift is just 50 nV/°C. CMRR is also guaranteed over temperature: 80 dB for G=1, increasing to 122 dB at a gain of 128. Voltage noise is just 0.7 uV p-p (0.01 Hz to 10 Hz).

The AD8231 also includes an uncommitted op amp which can be used for additional gain, differential signal driving or filtering. Like the in amp, the op amp has an autozero architecture, rail to rail input, and rail to rail output.

The AD8231 includes a shutdown feature that reduces current to 1 uA and makes the amplifier output high impedance. This allows easy multiplexing of multiple amplifiers without additional switches.

The AD8231 is specified over the extended industrial temperature range of -40°C to +125°C. It is available in a 4mm x 4mm 16-Lead LFCSP (Chip Scale) package.

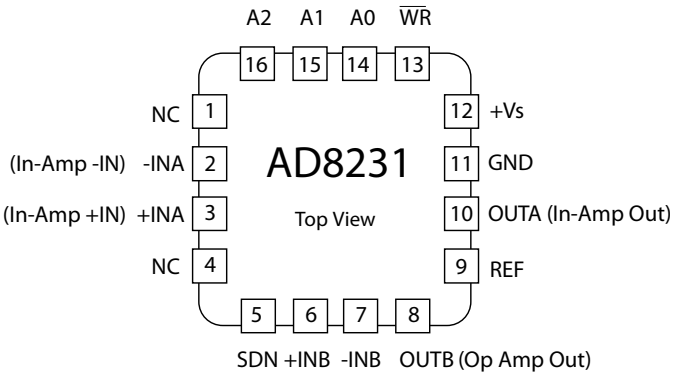
ABSOLUTE MAXIMUM RATINGS

Table 2. AD8231 Absolute Maximum Ratings

Parameter	Rating
Supply Voltage	
Internal Power Dissipation	
Output Short Circuit Current	
Input Voltage (Common-Mode)	
Differential Input Voltage	
Storage Temperature	–65°C to +150°C
Operational Temperature Range	–40°C to +125°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.



16-Lead LFCSP (Chip Scale) Package

Pin Number	Mnemonic	Function	Pin Number	Mnemonic	Function
1	NC	No connect	9	REF	Reference Pin to set the Output Level
2	-INA	Negative Input for In-amp	10	OUTA	Output for In Amp
3	+INA	Positive Input for In-amp	11	GND	Power Supply Ground
4	NC	No connect	12	+Vs	Positive Power Supply
5	$\overline{\text{SDN}}$	Shut Down	13	$\overline{\text{WR}}$	Write Enable to latch gain setting
6	+INB	Positive Input for Undedicated Op Amp	14	A0	Gain Setting Bit
7	-INB	Negative Input for Undedicated Op Amp	15	A1	Gain Setting Bit
8	OUTB	Output for Undedicated Op Amp	16	A2	Gain Setting Bit

GAIN SELECTION

The AD8231's gain is set by voltages applied to the A0, A1, and A2 pins. High (HI) or low (LO) voltage limits are listed in the specifications section. To change the gain, the $\overline{WR}$ pin must be driven low. When the $\overline{WR}$ pin is driven high, the gain is latched, and voltages at the A0-A2 pins will have no effect. Table 3 is the truth table showing the different gain settings.

$\overline{WR}$	A2	A1	A0	Gain
LO	LO	LO	LO	1
LO	LO	LO	HI	2
LO	LO	HI	LO	4
LO	LO	HI	HI	8
LO	HI	LO	LO	16
LO	HI	LO	HI	32
LO	HI	HI	LO	64
LO	HI	HI	HI	128
HI	X	X	X	No change

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.
