### Circuit description

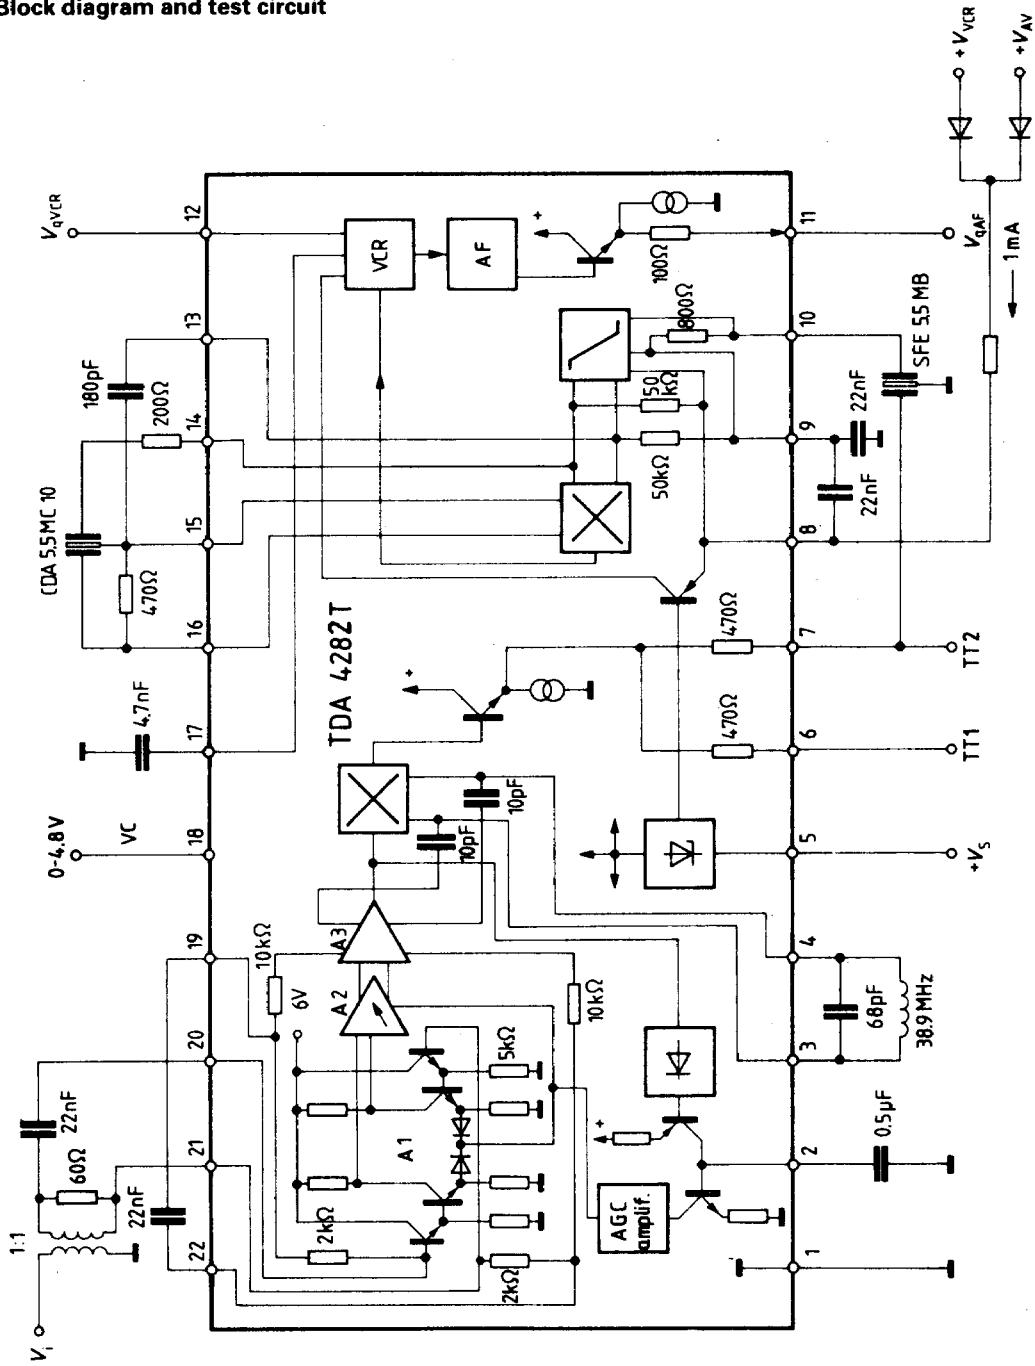

The TDA 4282 T contains essentially two functional blocks:

1. A regulated AM amplifier with a peak rectifier to generate the AGC voltage. The AM amplifier drives an FM demodulator, at the output of which the differential sound carrier (38.9 MHz–33.4 MHz = 5.5 MHz) is available. The double sideband portions close to the carrier are suppressed. The 5.5 MHz carrier reaches the functional block via an external selection.
2. An FM limiter amplifier with coincidence demodulator, a standard VCR connector and a separate AF output with volume control.
