

### Features

- Input voltage: 4.4V to 18V
- Output voltage: 0.8V to  $V_{CC}$ .
- Duty ratio: 0% to 99% PWM control
- Oscillation frequency: 300KHz typ.
- Current limit, Enable function
- Thermal Shutdown function
- Built-in internal SW P-channel MOS
- SOP-8L: Available in "Green" Molding Compound (no Br, Sb)
- Lead Free Finish/RoHS Compliant (Note 1)

### General Description

AP1534 consists of step-down switching regulator with PWM control. These devices include a reference voltage source, oscillation circuit, error amplifier, internal PMOS.

AP1534 provides low-ripple power, high efficiency, and excellent transient characteristics. The PWM control circuit is able to vary the duty ratio linearly from 0 up to 99%. This converter also contains an error amplifier circuit as well as a soft-start circuit that prevents overshoot at startup. An enable function, an over current protect function and a short circuit protect function are built inside, and when OCP or SCP happens, the operation frequency will be reduced from 300KHz to 50KHz. Also, an internal compensation block is built in to minimize external component count.

With the addition of an internal P-channel Power MOS, a coil, capacitors, and a diode connected externally, these ICs can function as step-down switching regulators. They serve as ideal power supply units for portable devices when coupled with the SOP-8L mini-packages, providing such outstanding features as low current consumption. Since this converter can accommodate an input voltage up to 18V, it is also suitable for the operation via an AC adapter.

### Applications

- PC Motherboard
- LCD Monitor
- Graphic Card
- DVD-Video Player
- Telecom Equipment
- ADSL Modem
- Printer and other Peripheral Equipment
- Microprocessor Core Supply

### Function Description

#### PWM Control

The AP1534 is a DC/DC converter that employs pulse width modulation (PWM) scheme. Its pulse width varies in the range of 0% to 99%, based on the output current loading. The output ripple voltage caused by the PWM high frequency switching can easily be reduced through an output filter. Therefore, this converter provides a low ripple output supply over a broad range of input voltage & output current loading

#### Under Voltage Lockout

The under voltage lockout circuit of the AP1534 assures that the high-side MOSFET driver remains in the off state whenever the supply voltage drops below 3.3V. Normal operation resumes once  $V_{CC}$  rises above 3.5V.

#### Current Limit Protection

The current limit threshold is set by external resistor  $R_{OCSET}$  connected from  $V_{CC}$  supply to OCSET pin. The internal sink current  $I_{OCSET}$  (90uA typical) across this resistor sets the voltage at OCSET pin. When the PWM voltage is less than the voltage at OCSET, an over-current condition is triggered.

The current limit threshold is given by the following equation:

$$I_{PEAK} \times R_{DS(ON)} = I_{OCSET} \times R_{OCSET}$$

$$I_{PEAK} > I_{OUT(MAX)} + \frac{(\Delta I)}{2}$$

where,

$$\Delta I = \frac{V_{IN} - V_{OUT}}{F_s \times L} \times \frac{V_{OUT}}{V_{IN}}$$

$I_{PEAK}$  is the output peak current;  $R_{DS(ON)}$  is the MOSFET ON resistance;  $F_s$  is the PWM frequency (300KHz typical). Also, the inductor value will affect the ripple current  $\Delta I$ .

The above equation is recommended for input voltage range of 5V to 18V. For input voltage lower than 5V, higher than 18V or ambient temperature over 100°C,  $R_{OCSET} \geq 6.8K\Omega$  is recommended.

The recommended minimum  $R_{OCSET}$  value is summarized below:

$V_{IN}$ (V)	$V_{OUT}$ (V)	$R_{OCSET}$ ( $\Omega$ )
4	1	6.8K
5	3.3	5.6K
12	5	3.9K
18	12	4.7K

The maximum  $R_{OCSET}$  value should not exceed AP1533 maximum current output.
