Analog Multiplexers/Demultiplexers

MC14051B
MC14052B
MC14053B

The MC14051B, MC14052B, and MC14053B analog multiplexers are digitally–controlled analog switches. The MC14051B effectively implements an SP8T solid state switch, the MC14052B a DP4T, and the MC14053B a Triple SPDT. All three devices feature low ON impedance and very low OFF leakage current. Control of analog signals up to the complete supply voltage range can be achieved.

- Triple Diode Protection on Control Inputs
- Switch Function is Break Before Make
- Supply Voltage Range = 3.0 Vdc to 18 Vdc
- Analog Voltage Range ($V_{DD} - V_{EE}$) = 3.0 to 18 V
  Note: V_{EE} must be ≤ V_{SS}
- Linearized Transfer Characteristics
- Low–noise – 12 nV/√Cycle, f ≥ 1.0 kHz Typical
- Pin–for–Pin Replacement for CD4051, CD4052, and CD4053
- For 4PDT Switch, See MC14551B
- For Lower R_{ON}, Use the HC4051, HC4052, or HC4053 High–Speed CMOS Devices

#Data labeled "Typ" is not to be used for design purposes, but is intended as an indication of the IC's potential performance.

* For voltage drops across the switch (ΔV_{switch}) > 600 mV (> 300 mV at high temperature), excessive V_{DD} current may be drawn, i.e. the current out of the switch may contain both V_{DD} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded. (See first page of this data sheet.)

* The formulas given are for the typical characteristics only at 25°C.
#Data labelled "Typ" is not lo be used for design purposes but In intended as an indication of the IC's potential performance.

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range $V_{SS} \leq (V_{in}$ or $V_{out}) \leq V_{DD}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS}, V_{EE}, or V_{DD}). Unused outputs must be left open.

APPLICATIONS INFORMATION

Figure A illustrates use of the on–chip level converter detailed in Figures 2, 3, and 4. The 0–to–5 V Digital Control signal is used to directly control a 9 V_{p-p} analog signal.

The digital control logic levels are determined by V_{DD} and V_{SS}. The V_{DD} voltage is the logic high voltage; the V_{SS} voltage is logic low. For the example, V_{DD} = + 5 V = logic high at the control inputs; V_{SS} = GND = 0 V = logic low.

The maximum analog signal level is determined by V_{DD} and V_{EE}. The V_{DD} voltage determines the maximum recommended peak above V_{SS}. The V_{EE} voltage determines the maximum swing below V_{SS}. For the example, $V_{DD} - V_{SS}$ = 5 V maximum swing above V_{SS}; $V_{SS} - V_{EE}$ = 5 V maximum swing below V_{SS}. The example shows a ± 4.5 V signal which allows a 1/2 volt margin at each peak. If voltage transients above V_{DD} and/or below V_{EE} are anticipated on the analog channels, external diodes (Dx) are recommended as shown in Figure B. These diodes should be small signal types able to absorb the maximum anticipated current surges during clipping.

The *absolute* maximum potential difference between V_{DD} and V_{EE} is 18.0 V. Most parameters are specified up to 15 V which is the *recommended* maximum difference between V_{DD} and V_{EE}.

Balanced supplies are not required. However, V_{SS} must be greater than or equal to V_{EE}. For example, V_{DD} = + 10 V, V_{SS} = + 5 V, and V_{EE} – 3 V is acceptable. See the Table below.

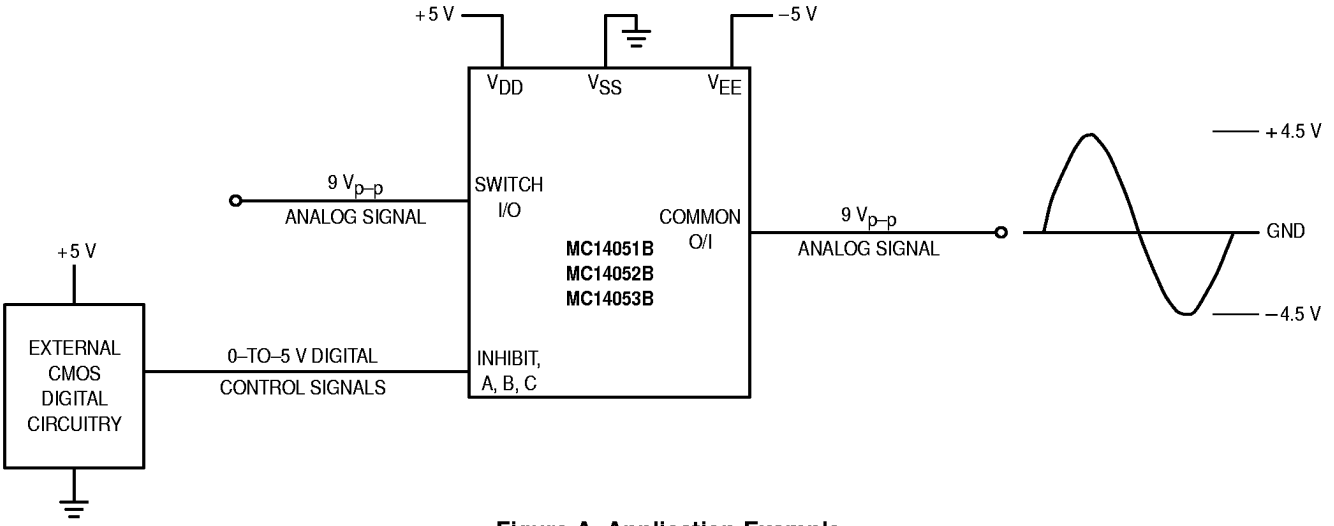

Figure A. Application Example

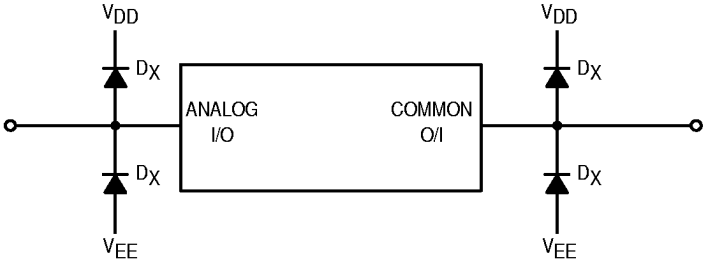

Figure B. External Germanium or Schottky Clipping Diodes

POSSIBLE SUPPLY CONNECTIONS

V_{DD} In Volts	V_{SS} In Volts	V_{EE} In Volts	Control Inputs Logic High/Logic Low In Volts	Maximum Analog Signal Range In Volts
+ 8	0	– 8	+ 8/0	+ 8 to – 8 = 16 V_{p-p}
+ 5	0	– 12	+ 5/0	+ 5 to – 12 = 17 V_{p-p}
+ 5	0	0	+ 5/0	+ 5 to 0 = 5 V_{p-p}
+ 5	0	– 5	+ 5/0	+ 5 to – 5 = 10 V_{p-p}
+ 10	+ 5	– 5	+ 10/ + 5	+ 10 to – 5 = 15 V_{p-p}
